

# Longitude and latitude

**How do we describe a location?**

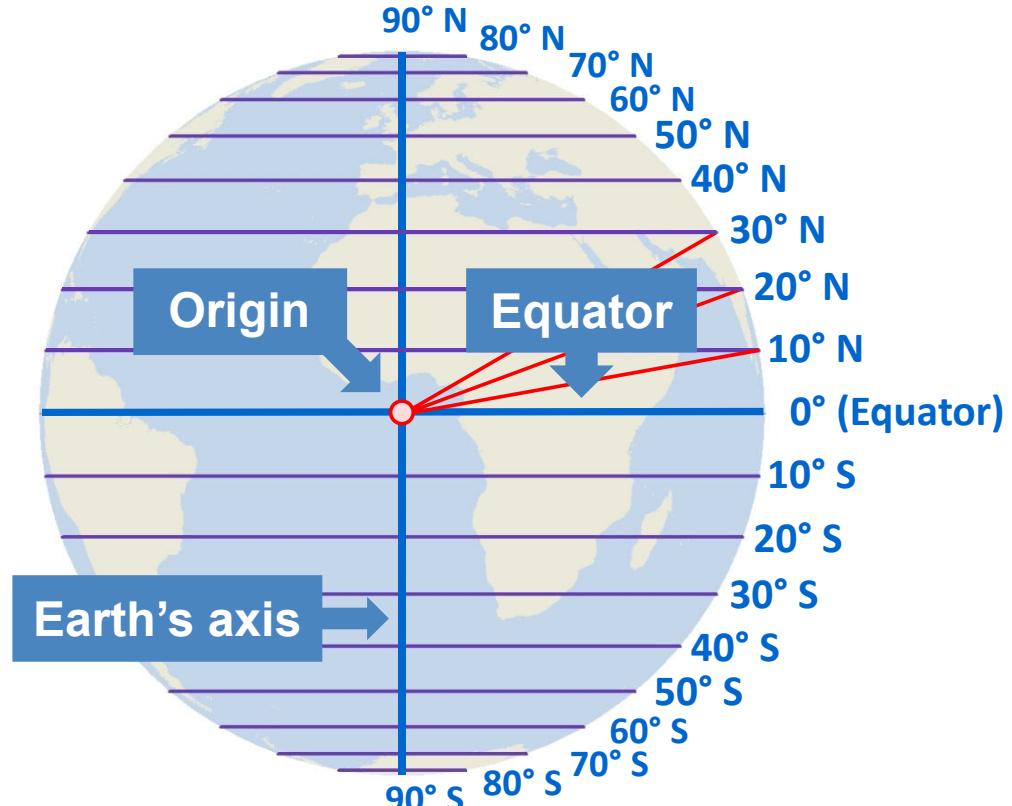

(adapted from Kimmerling *et al.*, 2009)

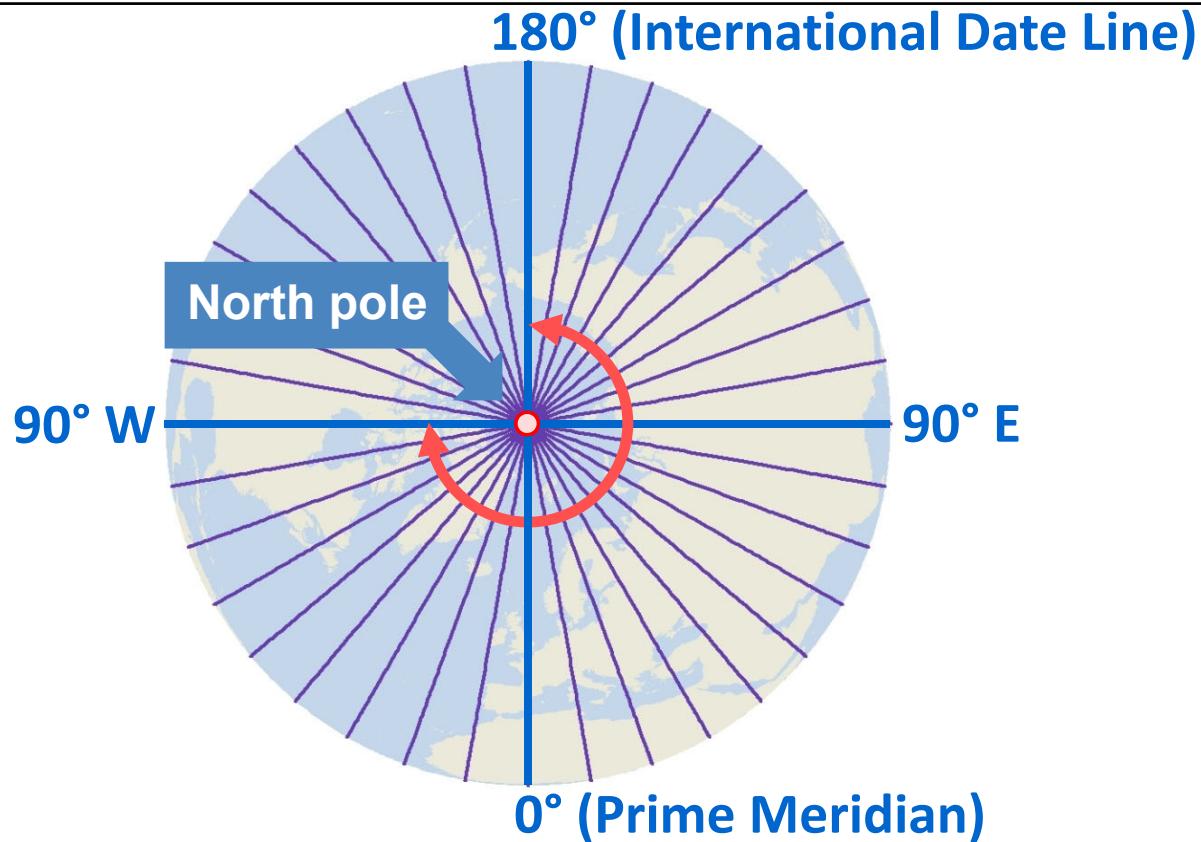

## Angular unit of measure

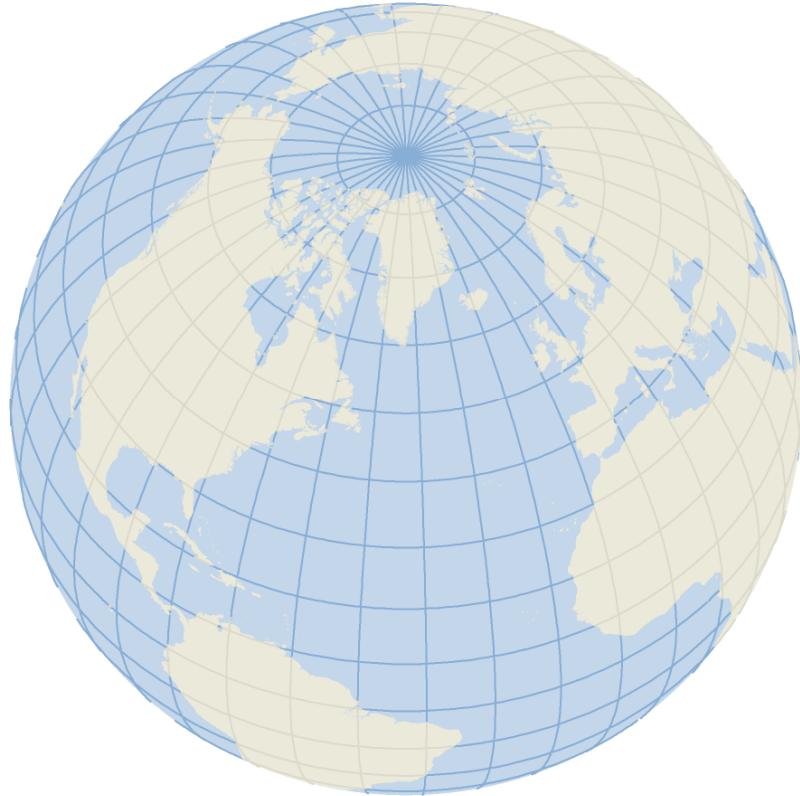

## Longitude and latitude

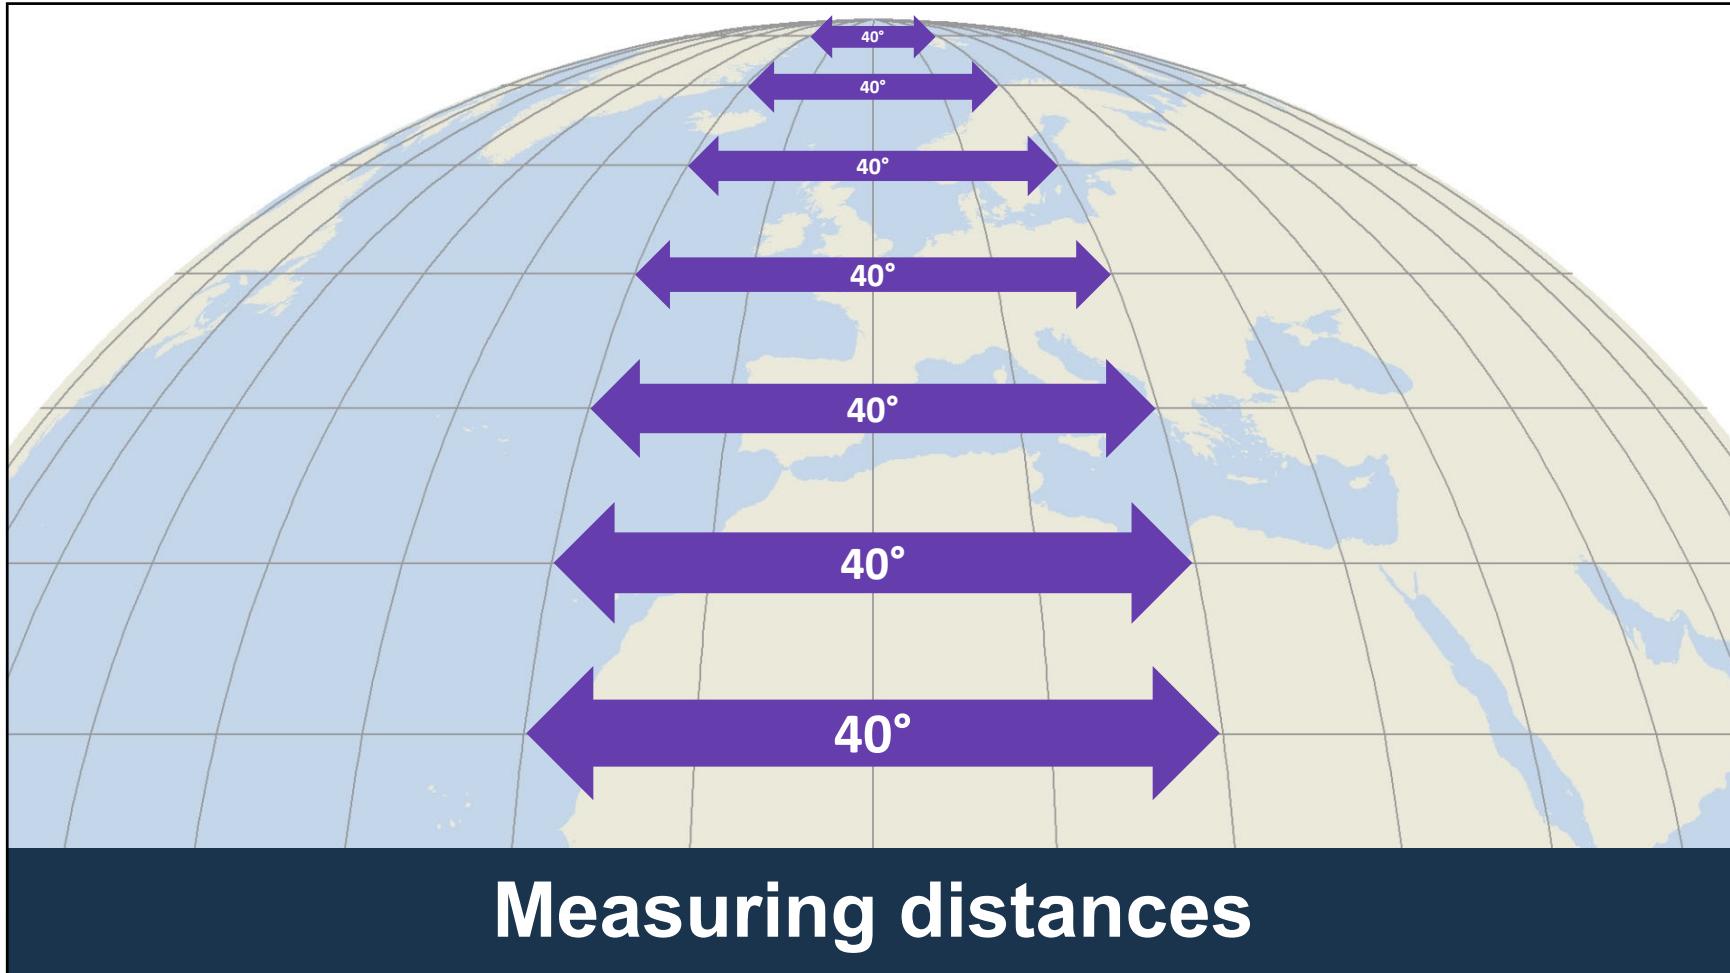

## Latitude (parallels)

**Longitude (meridians)**

# Graticule

Royal Observatory

# Defining the prime meridian

# Why Greenwich?

- Chosen in 1884
- Was already basis for U.S. time zones, most sea charts

## Royal Observatory

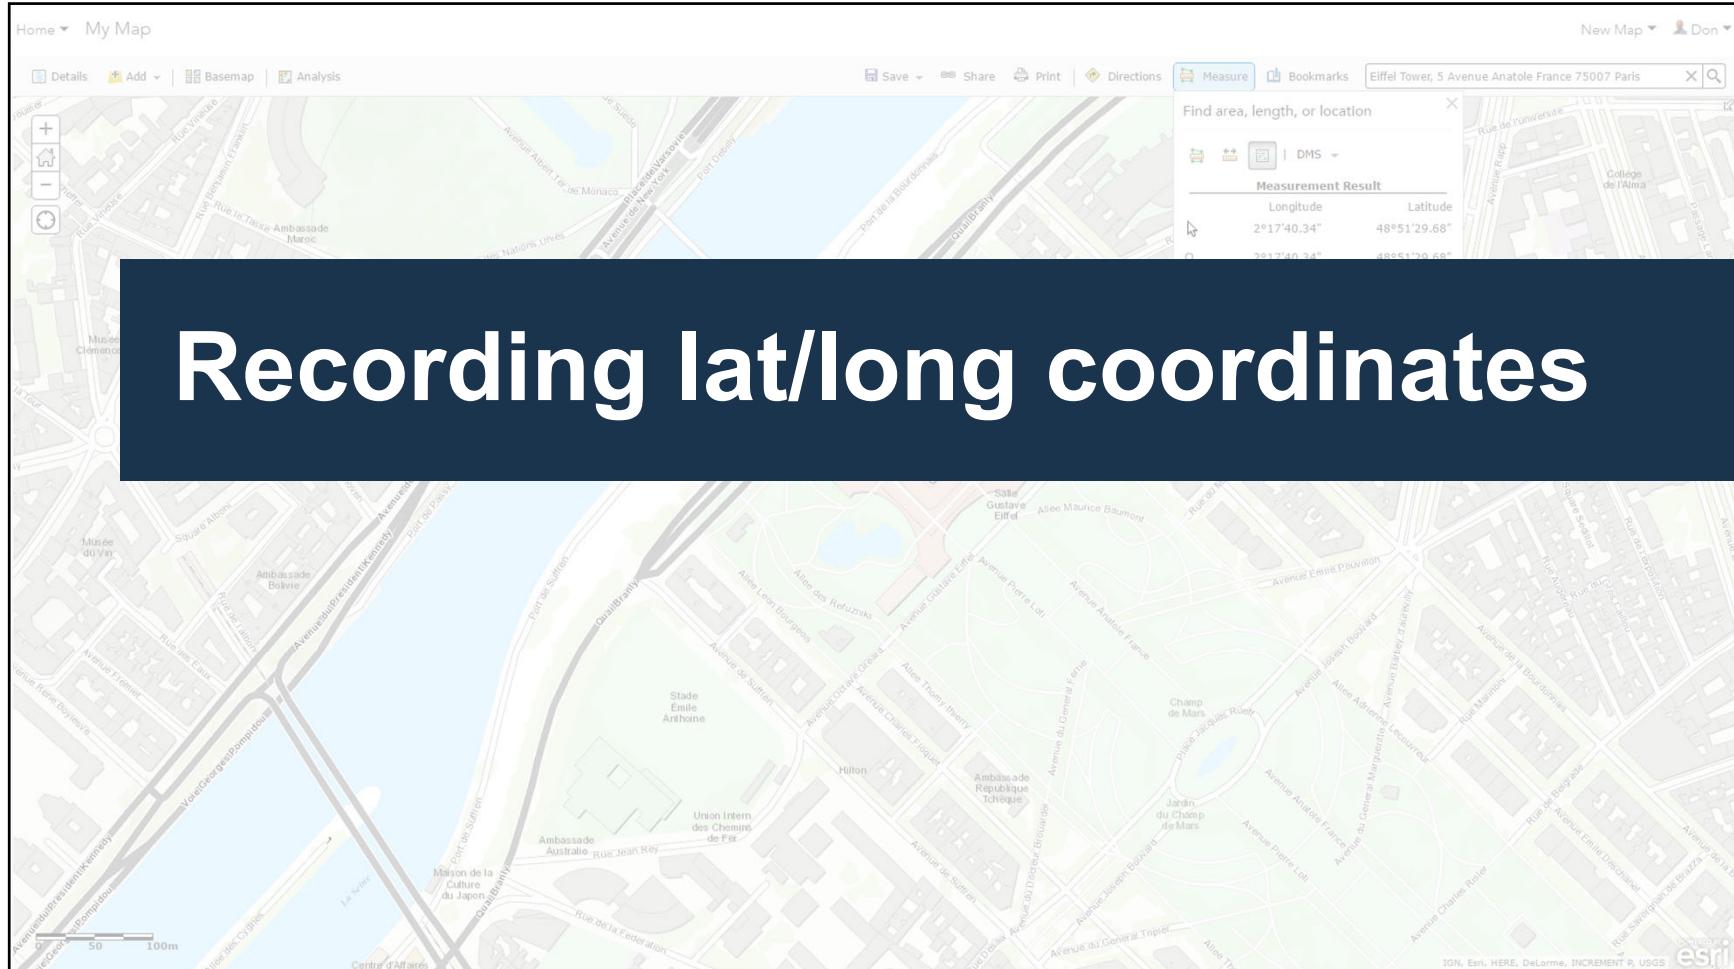

# Where in Greenwich?

Photomechanical print after Lock & Whitfield

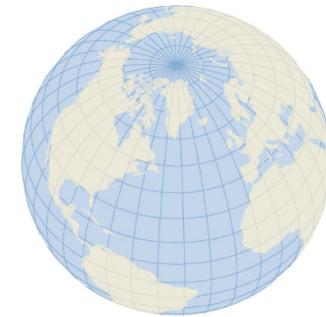

## Where in the Observatory?

# Long/Lat Coordinates

- Sexagesimal (base 60) system
- Degrees, Minutes, Seconds (DMS)
  - ◆ e.g.  $142^\circ 32' 23''$

1 degree = 60 minutes

1 minute = 60 seconds.

2.294538	48.858243

Recording coordinates

## Decimal degree signs

**121° 8' 6"**

## Converting DMS/DD coordinates

$$= 121 + (8/60) + (6/3600)$$

$$= 121.135$$

**121° 8' 6"**

$$= D + (M/60) + (S/3600)$$

$$= 121 + (8/60) + (6/3600)$$

$$= 121.135$$

**Degrees, Minutes, Seconds → Decimal Degrees**

**121°135**

$$.135 \times 60 = 8.1$$

$$.1 \times 60 = 6$$

**121° 8' 6"**

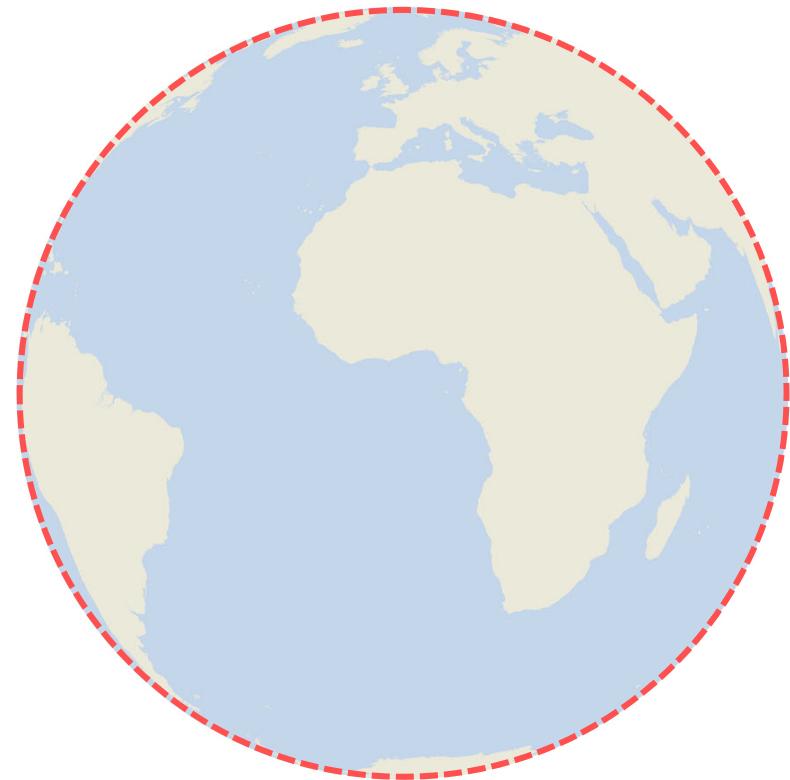

**Decimal degrees → Degrees, minutes, seconds**

# The Earth as an Ellipsoid

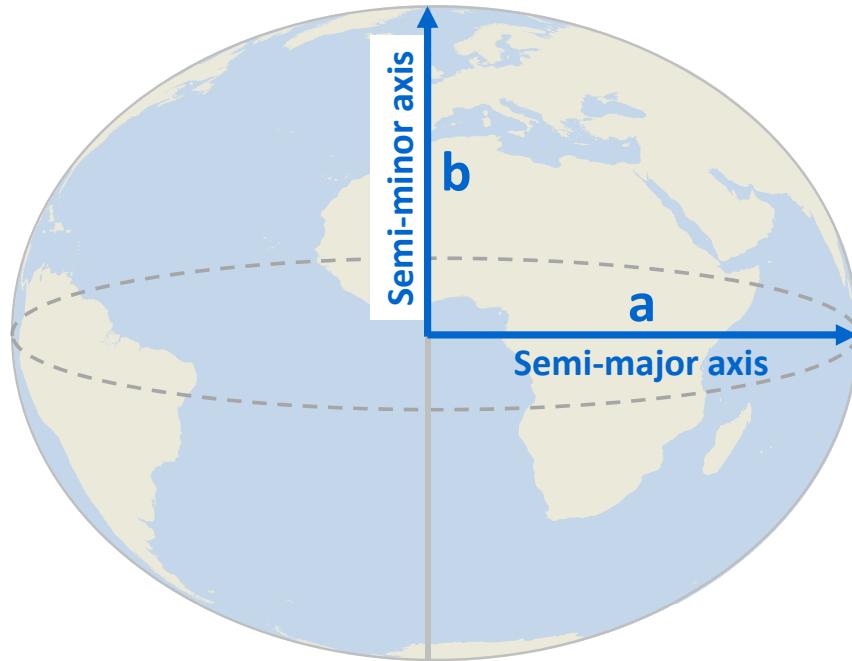

$$f \approx \frac{1}{300}$$

**The earth is not round**

## Flattening and bulging

$$f = \frac{a - b}{a}$$

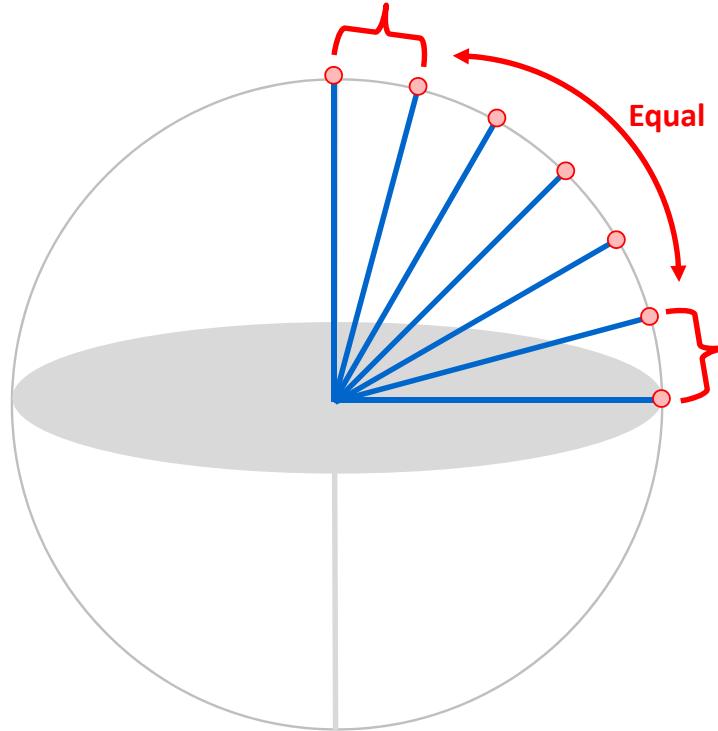

$$f \approx \frac{1}{300}$$

Earth can be modeled as an ellipsoid

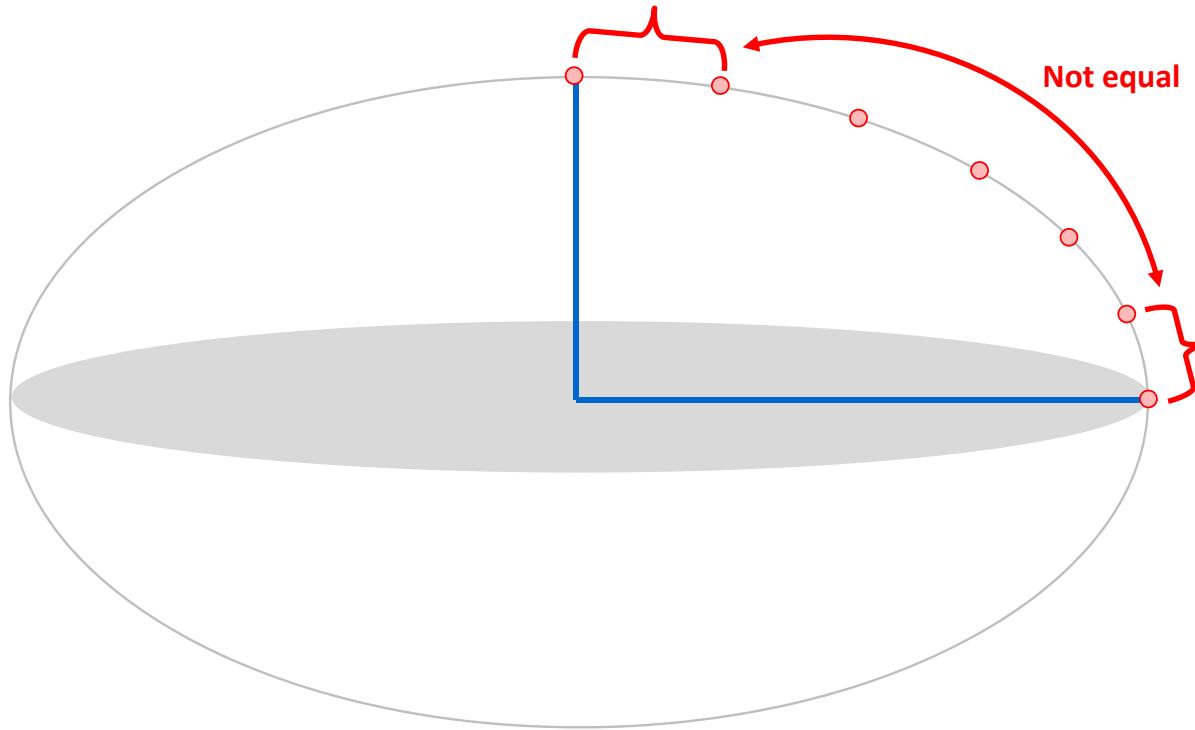

<b>Ellipsoid</b>	<b>Semi-major axis (m)</b>	<b>Flattening (1/f)</b>
Airy 1830	6,377,563.396	299.3249646
Australian National	6,377,340.189	298.25
Clarke 1866	6,378,206.4	294.9786982
International 1924	6,378,388	297
GRS 80	6,378,137	298.257222101

(adapted from Lo and Yeung, 2006)

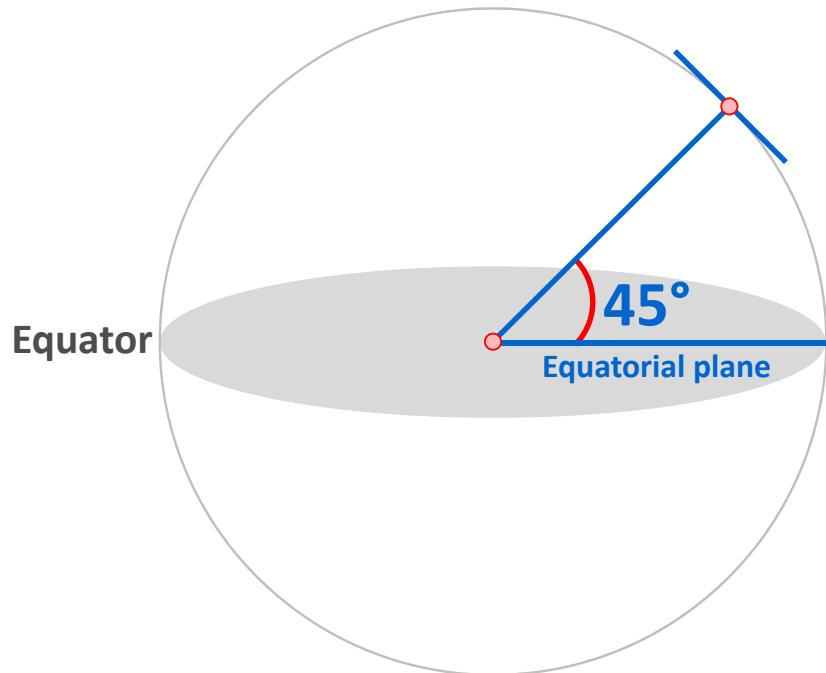

## Ellipsoid Examples

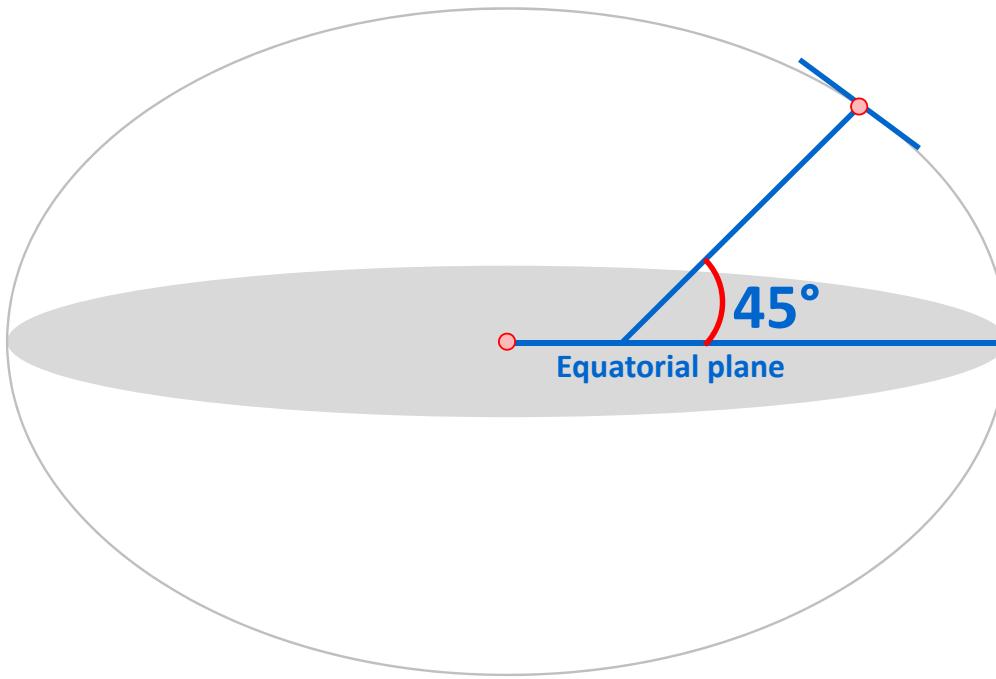

If the earth was a sphere...

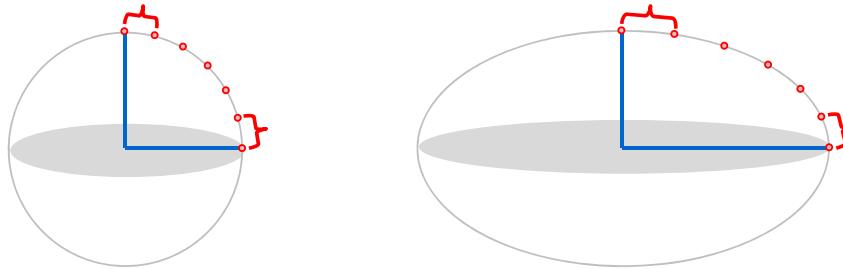

If the earth is an ellipsoid...

## Geocentric latitude

## Geodetic latitude

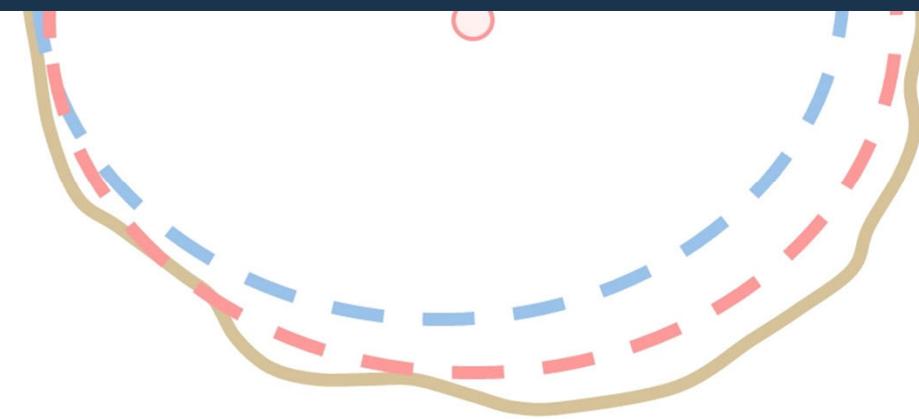

- If you treat the Earth as a sphere to measure distance you will be off by about 1 km for every 110 km (~1%)
- 1:5 million or smaller: not noticeable, use **geocentric**
- 1:1 million or larger: noticeable, use **geodetic**.

## Distance measurements

The diagram shows a cross-section of the Earth's surface, represented by a brown curved line. Three horizontal datums are overlaid: a blue dashed line at the top, a red dashed line in the middle, and a solid brown line at the bottom. A small blue circle is positioned on the blue dashed line, and a small pink circle is positioned on the red dashed line. The text 'Earth's surface' is written above the brown line, 'Local datum' is written above the blue line, and 'Earth-centered datum' is written above the red line.

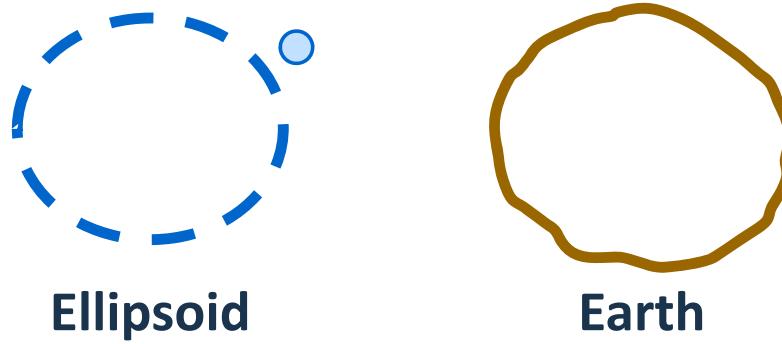

Earth's surface  
Local datum  
Earth-centered datum

## Horizontal datum

# Ellipsoids

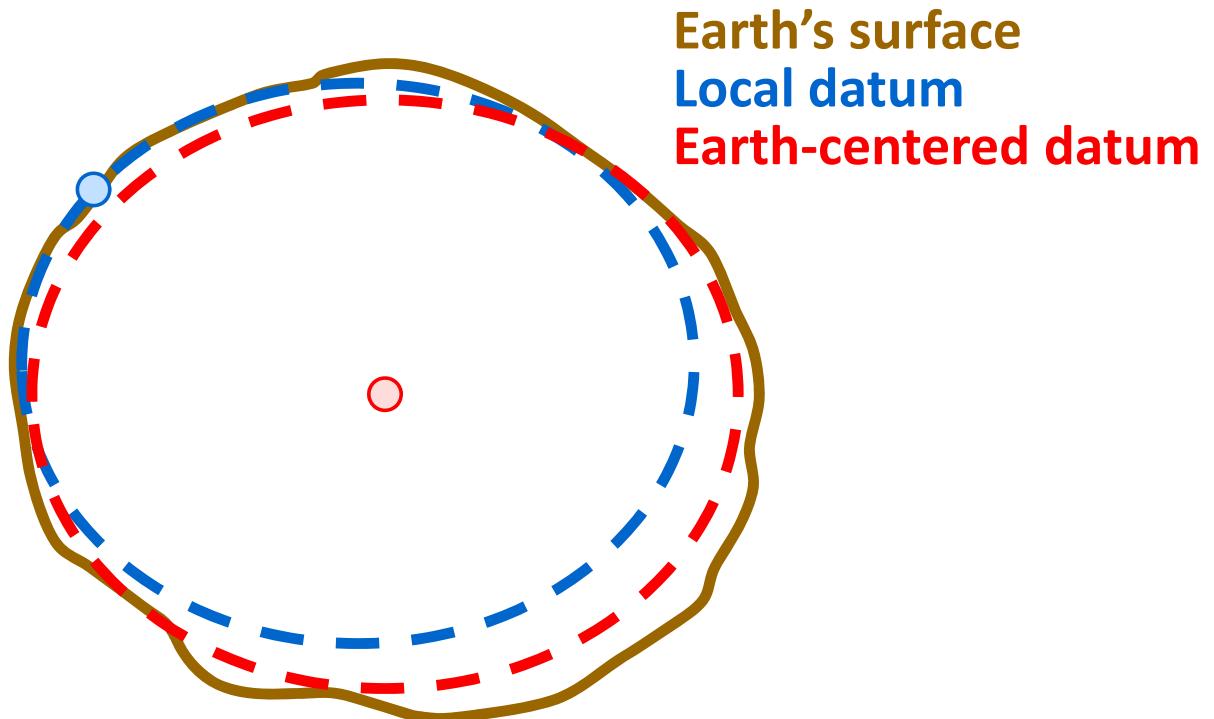

- Each ellipsoid is designed to approximate the Earth's shape for one part of the planet
- How do we specify *which part?*
  - ◆ Use a datum.

Specifies ellipsoid used and its location

point on ellipsoid linked to point on earth  
(the origin, from which all other points are calculated).

Datum

## Datum comparison

# Datums

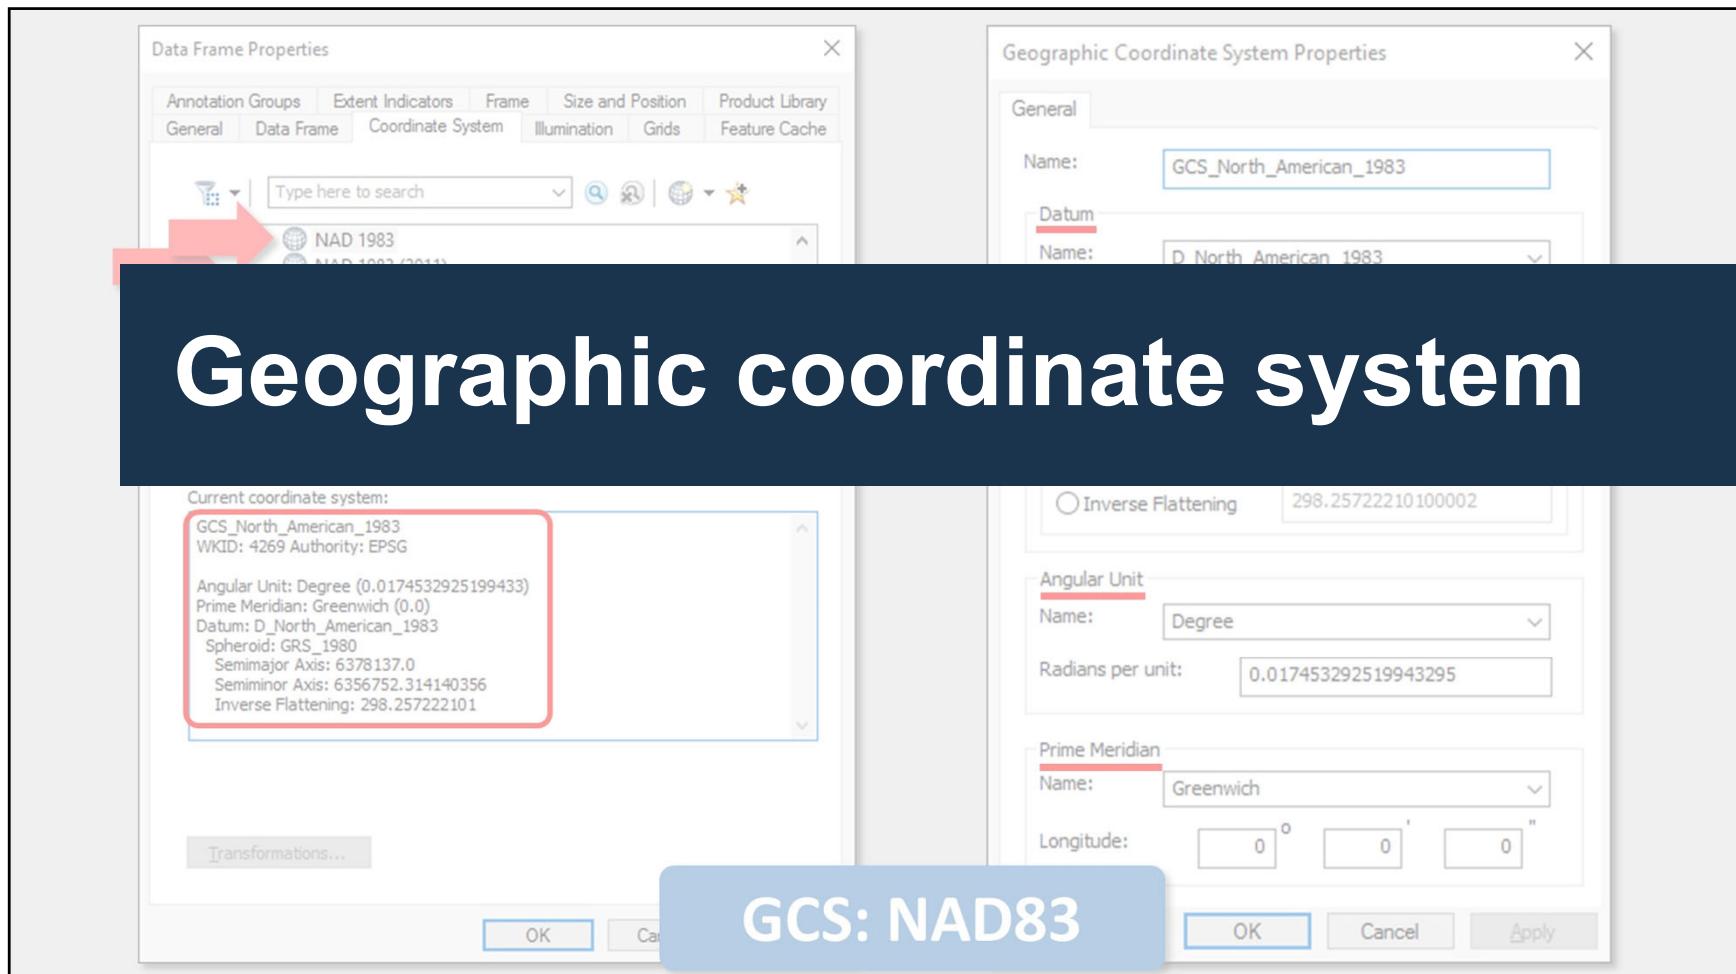

- Hundreds of different ellipsoids and datums have been used since the first estimates of the earth's size were made by Aristotle

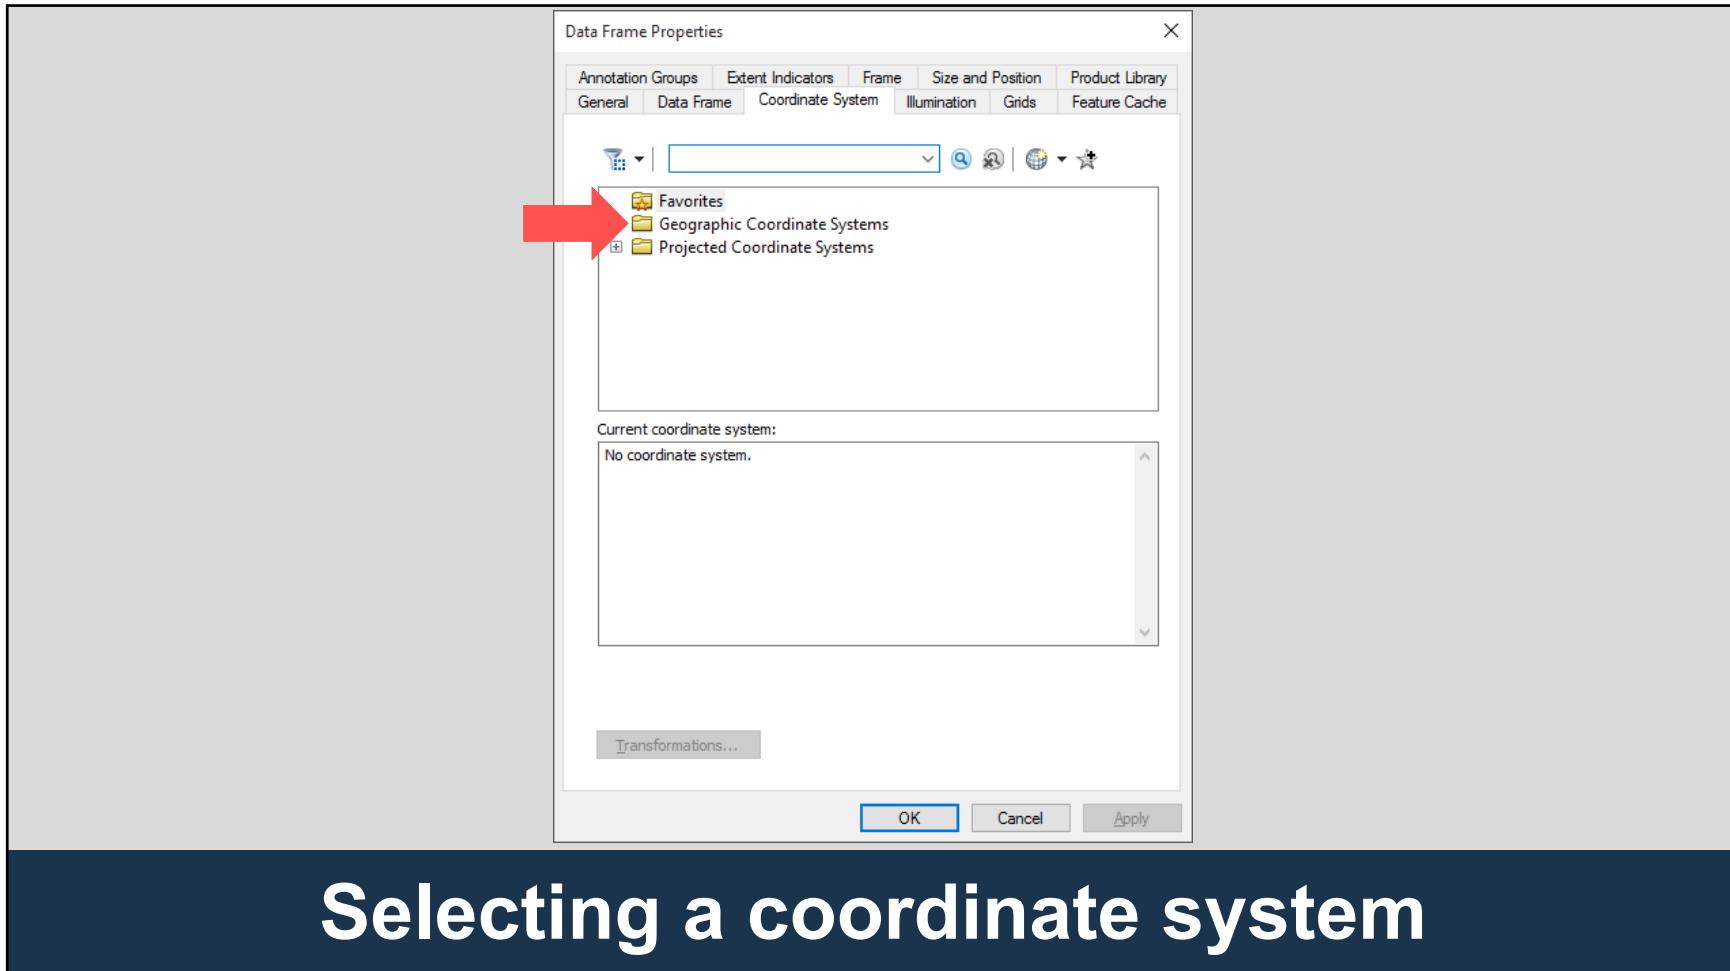

Datum Elements	NAD 27	NAD 83
Ellipsoid	Clarke 1866	GRS 80
Semi-major axis	6,378,206.4 m	6,378,137.0 m
Datum origin	Meades Ranch, Kansas	Center of Earth's mass
Control points	25,000	250,000
Best fitting	North America	Worldwide

(adapted from Lo and Yeung, 2006)

## NAD 27 vs. NAD 83

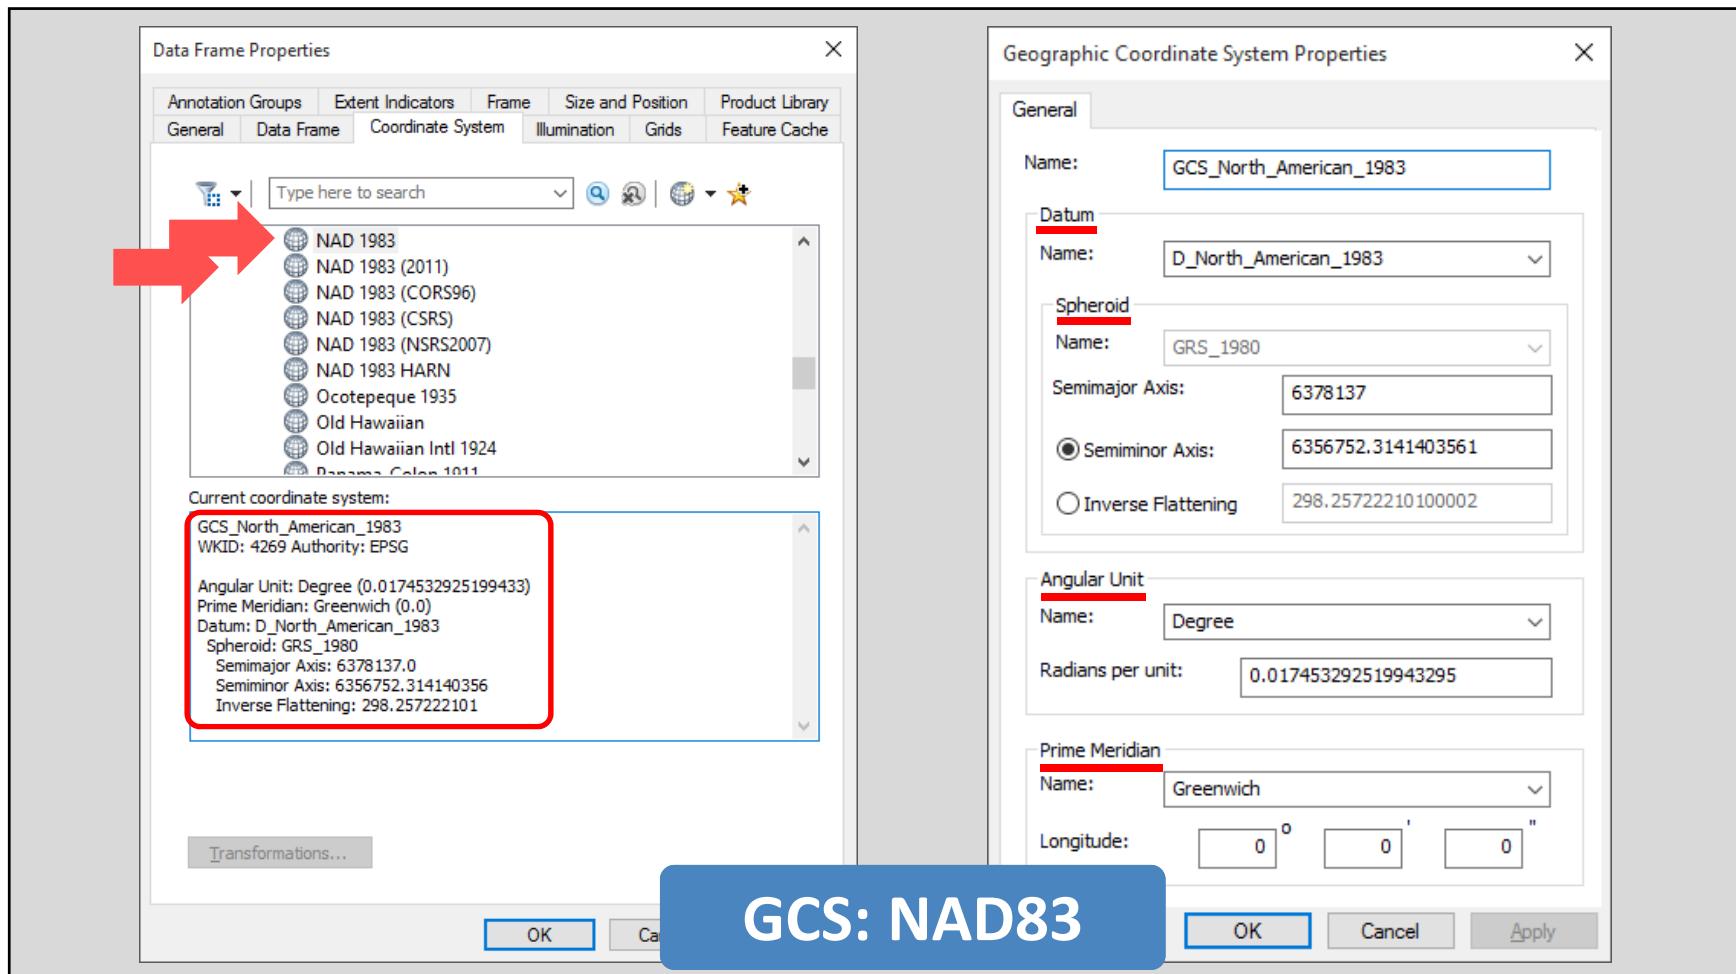

# Geographic Coordinate System

- Consists of:
  - ◆ Angular unit of measure
  - ◆ Prime meridian
  - ◆ Datum
    - Specifies an ellipsoid
- There are many different ellipsoids, so there are many different geographic coordinate systems.

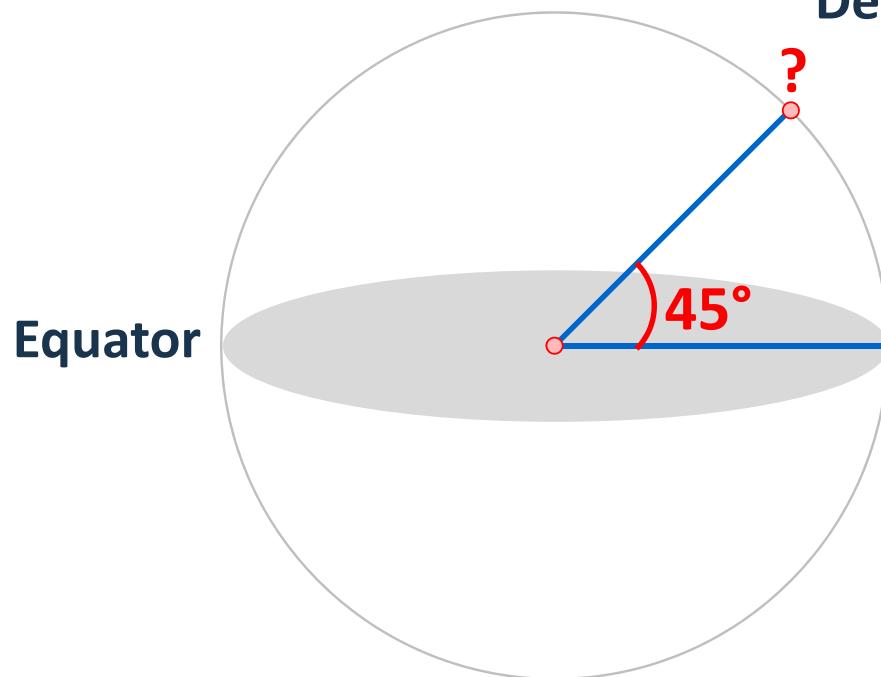

# Changing horizontal datums

Goddess of Liberty

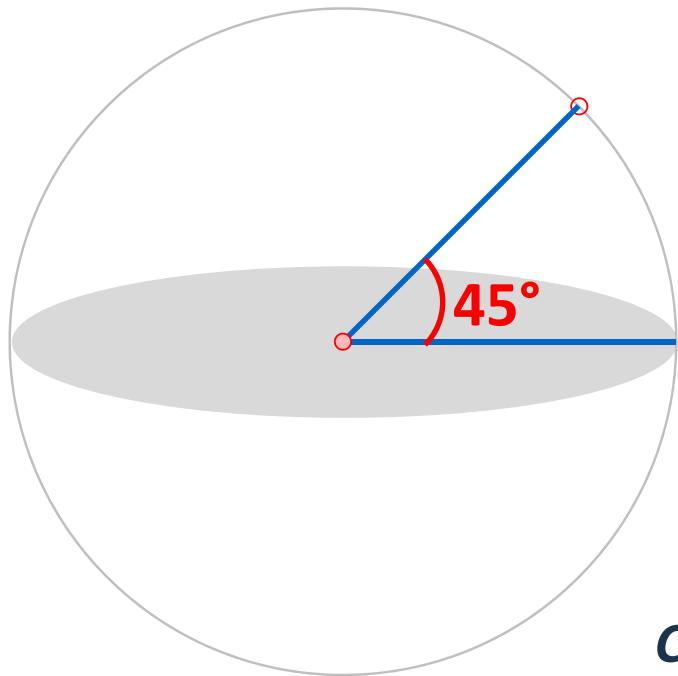

# Changing datums

- Geographic coordinate system
  - ◆ Angular unit of measure
  - ◆ Prime meridian
  - ◆ Datum
    - Based on an ellipsoid
- Since the datum is part of the definition, if you change the datum, you are changing the geographic coordinate system, so your coordinates will change.

Describe position using  
angle from center.  
**Latitude:  $45^\circ$**

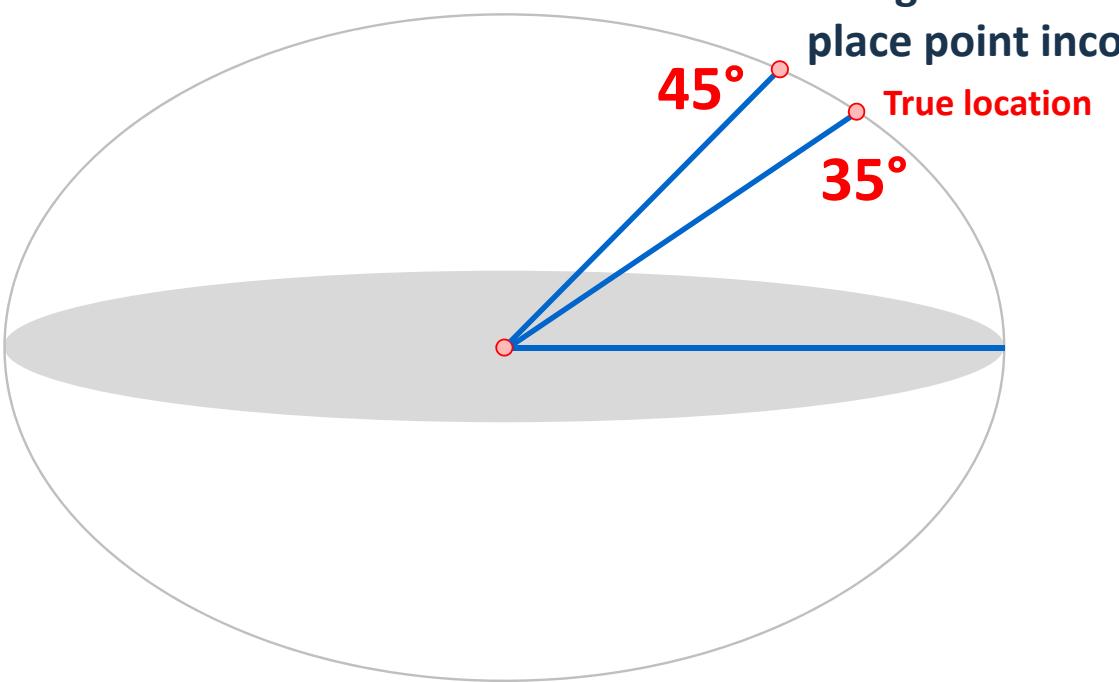

## Determining latitude on a sphere

*Point is no longer  
at 45° latitude*

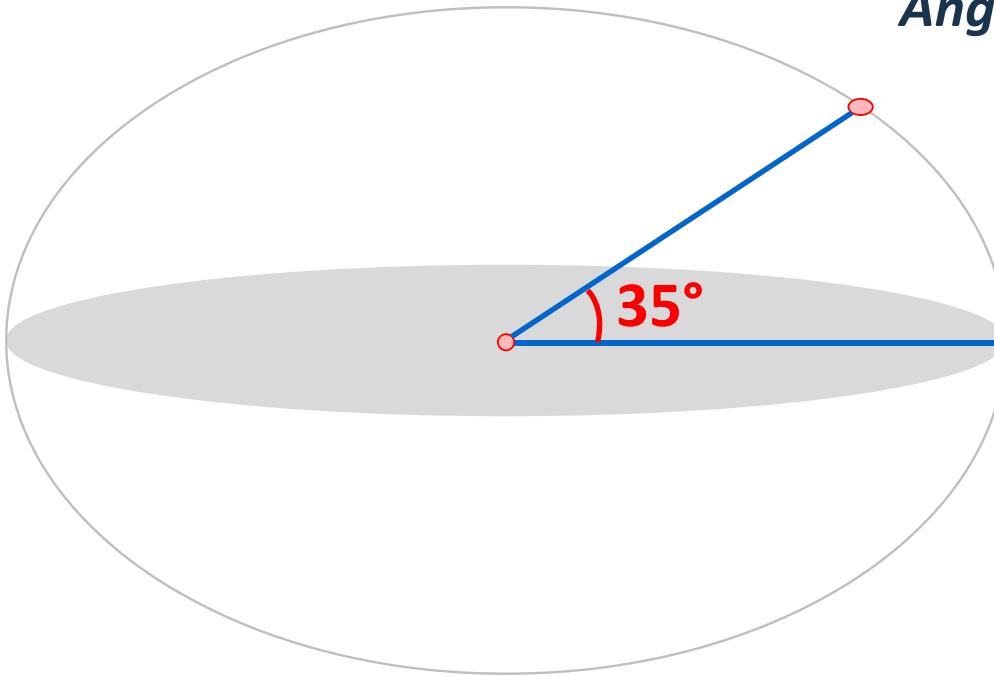

*Changing the shape  
also changes the angle*

**If sphere changes to an ellipsoid...**

**Put another way...**

*Angle changed  
again.*

## Changing ellipsoids

# Geographic coordinates

- The datum (and, therefore, the ellipsoid) is the frame of reference for the coordinates
- When you map angular coordinates, you must use the same datum that was used to originally measure them.

## In other words...

- The same location will have different coordinates on a sphere vs. an ellipsoid, and also on different ellipsoids

# Changing datums

Same point in Redlands, California:

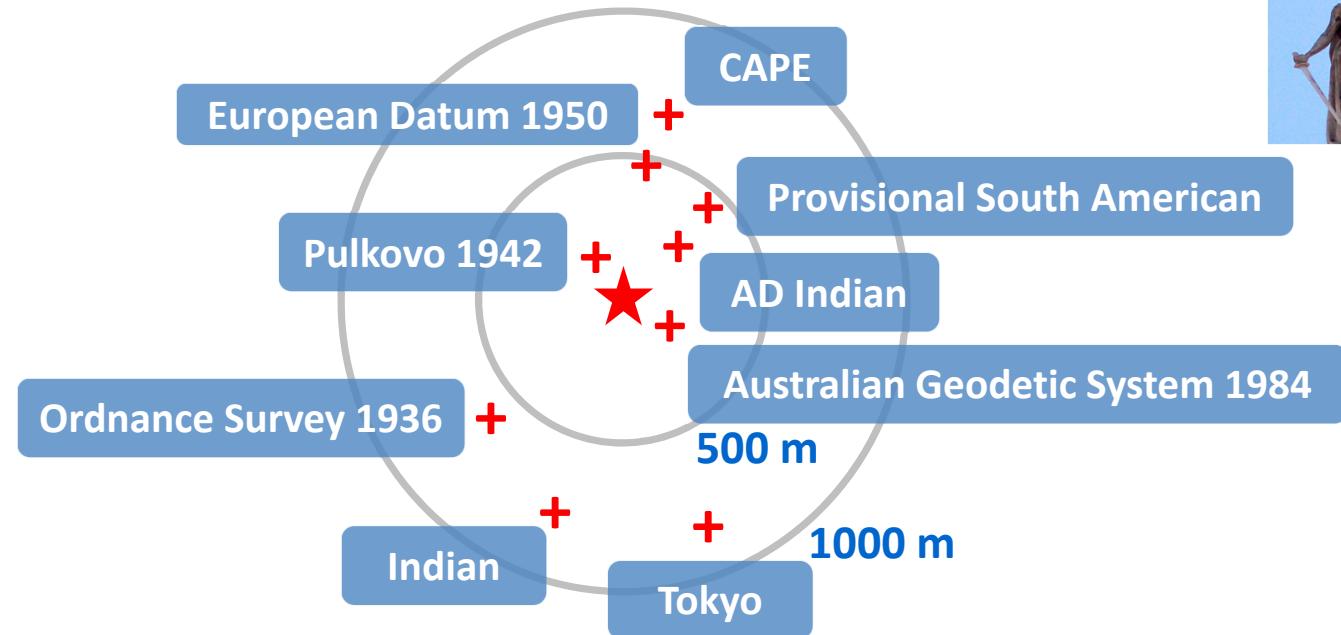

NAD 27: -117° 12' 54.61539"    34° 01' 43.72995"

NAD 83: -117° 12' 57.75961"    34° 01' 43.77884

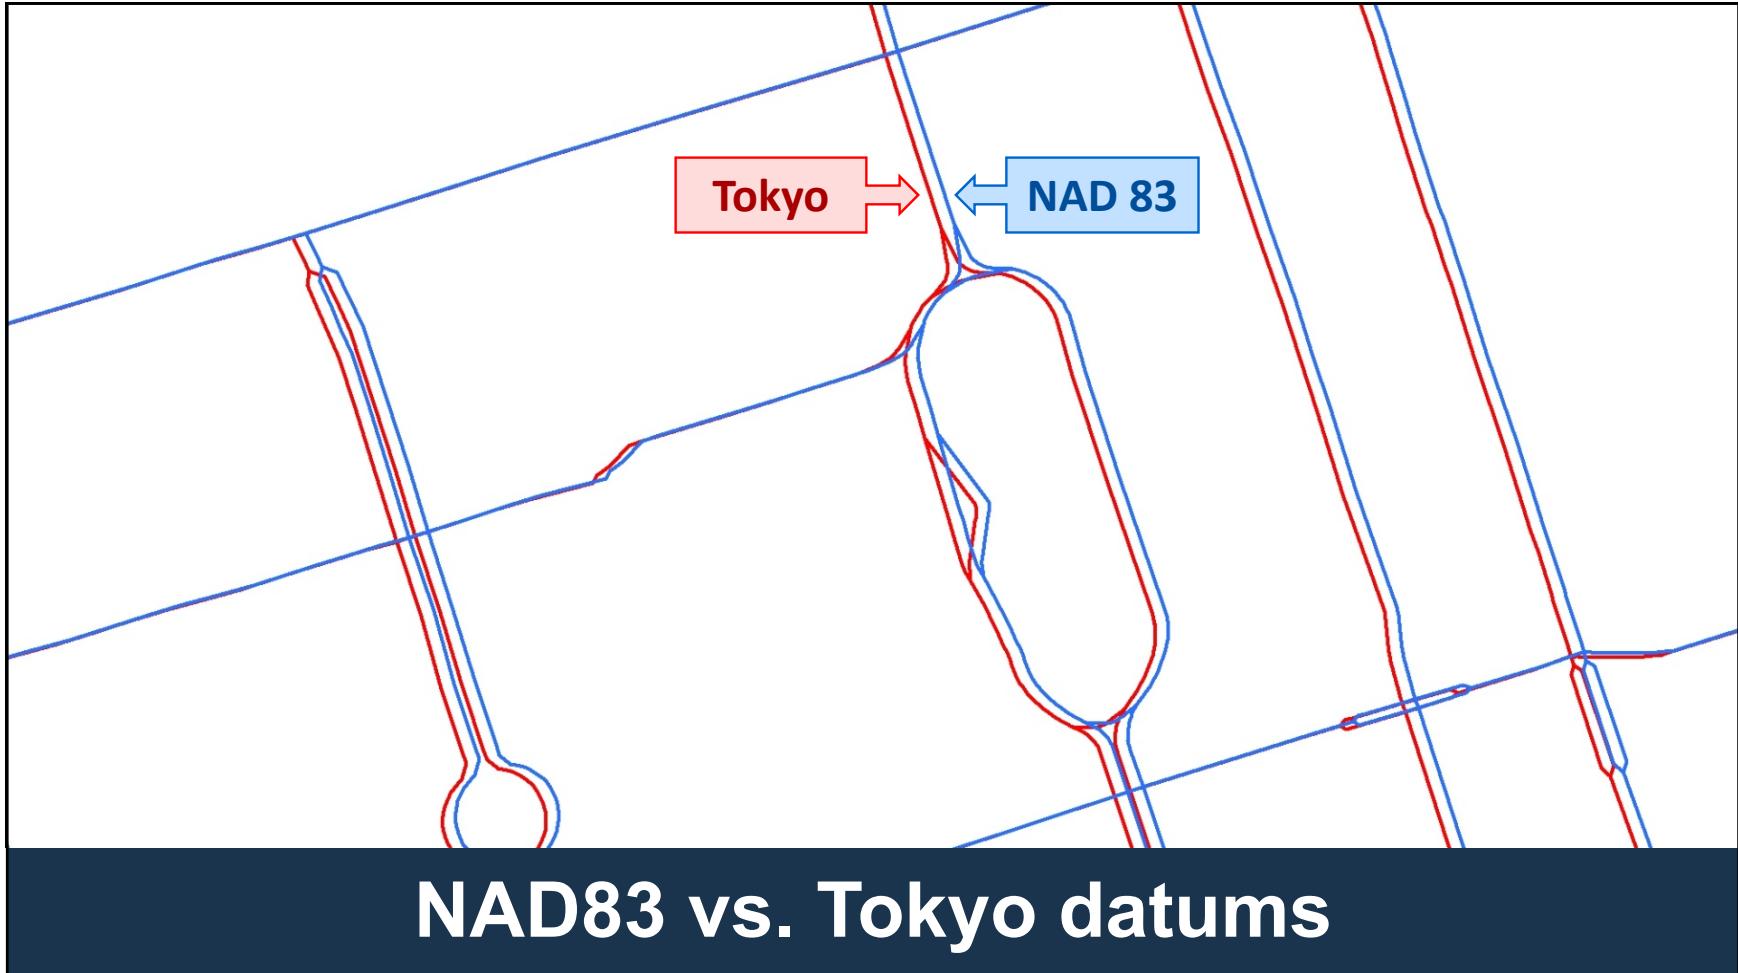

Goddess of Liberty

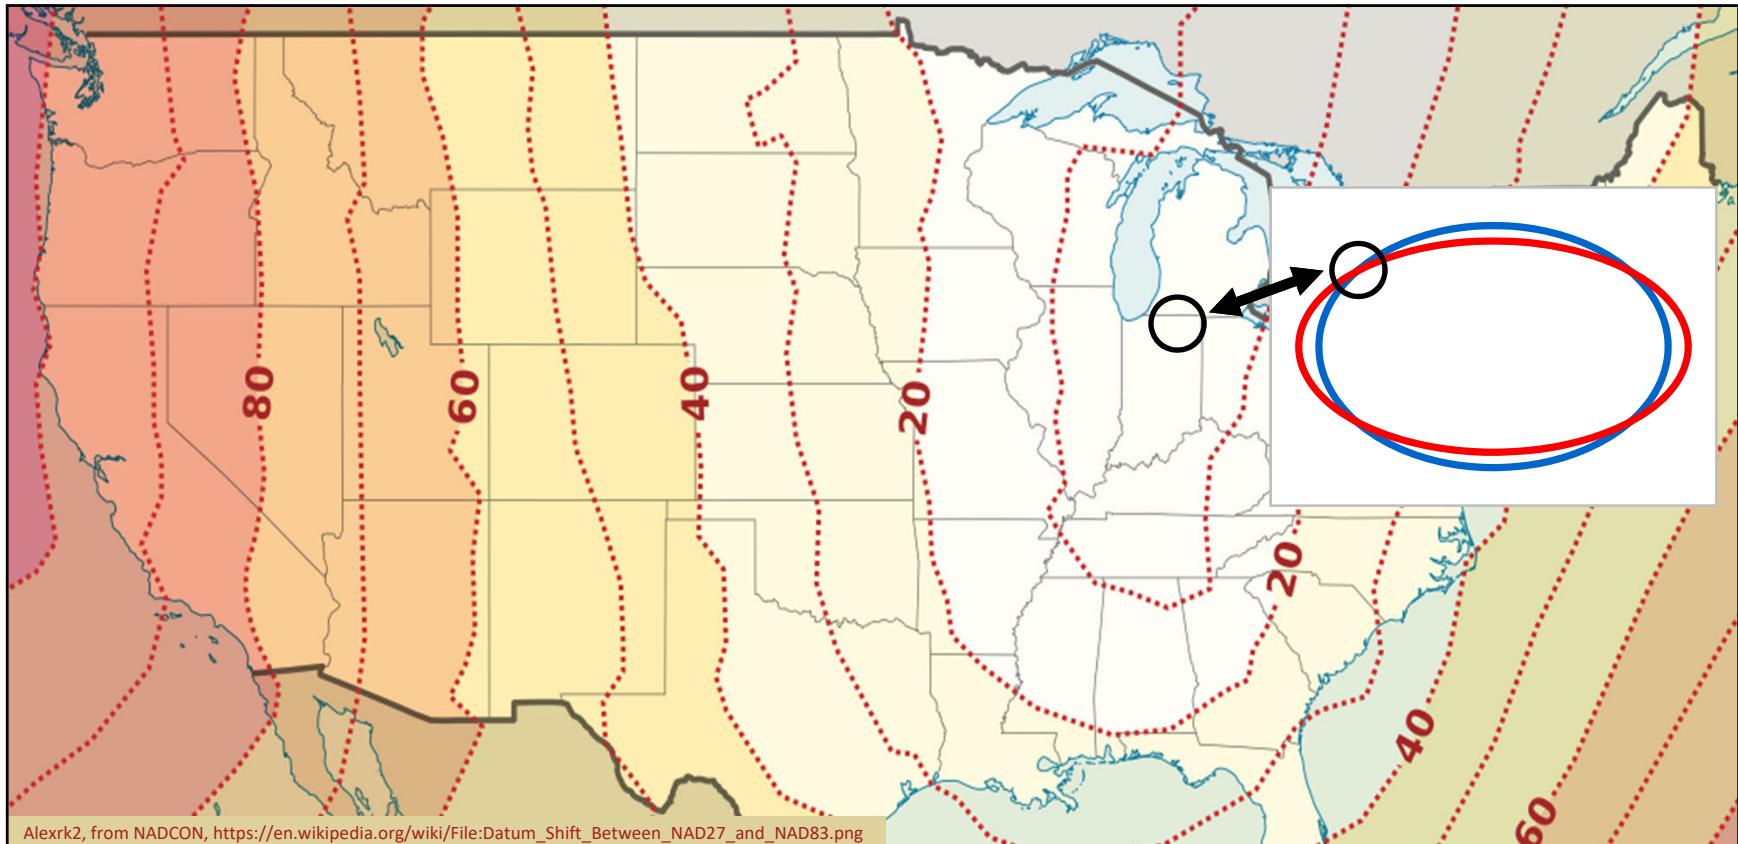

## Texas State Capitol Building, Austin

<http://www.colorado.edu/geography/gcraft/notes/datum/datum.html>

## Datum differences

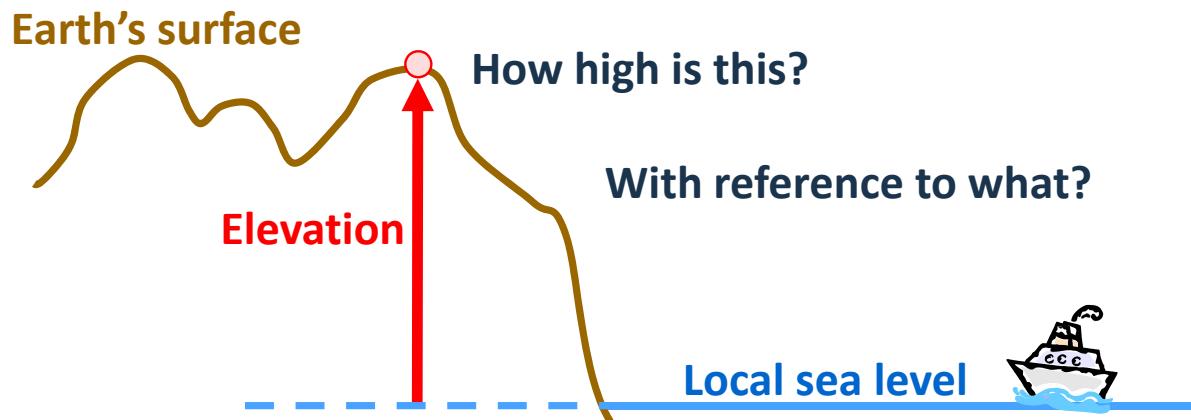

Difference (m) of same coordinates in NAD 27 vs NAD 83

# Datums and GIS

- Data acquisition
  - ◆ must know datum used to create data
  - ◆ if wrong one used, will have measurement errors, objects may not line up properly

# Vertical datum

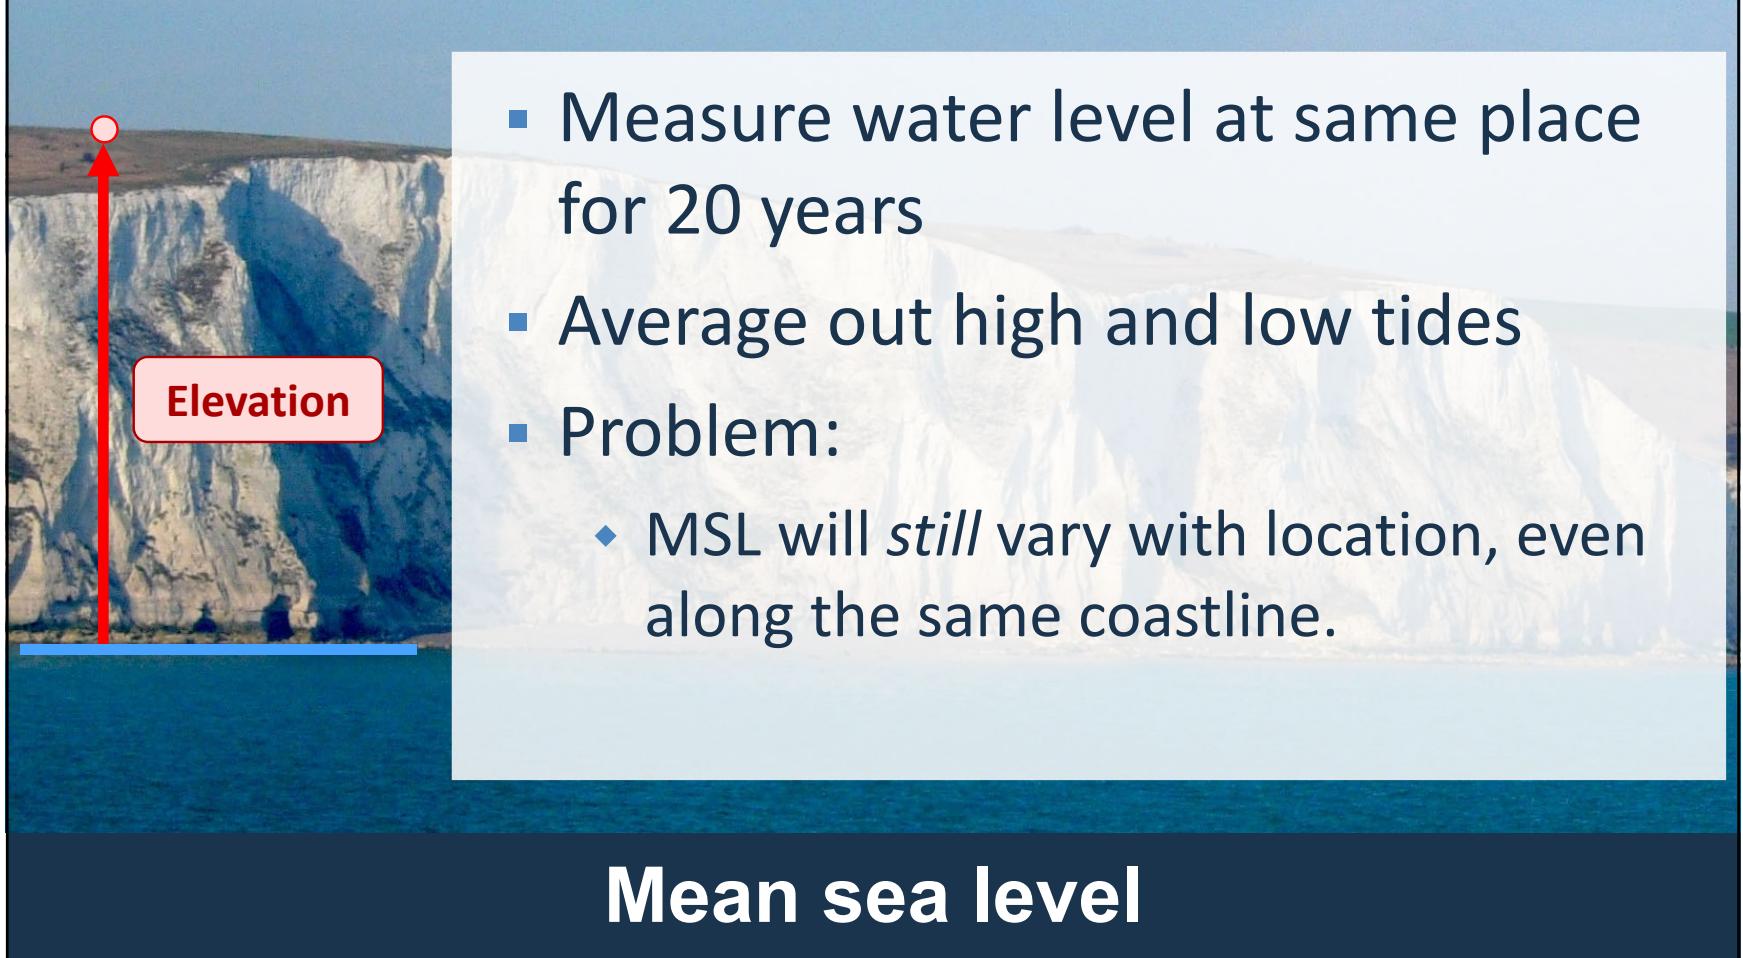

## Vertical Position

**Sea level:**

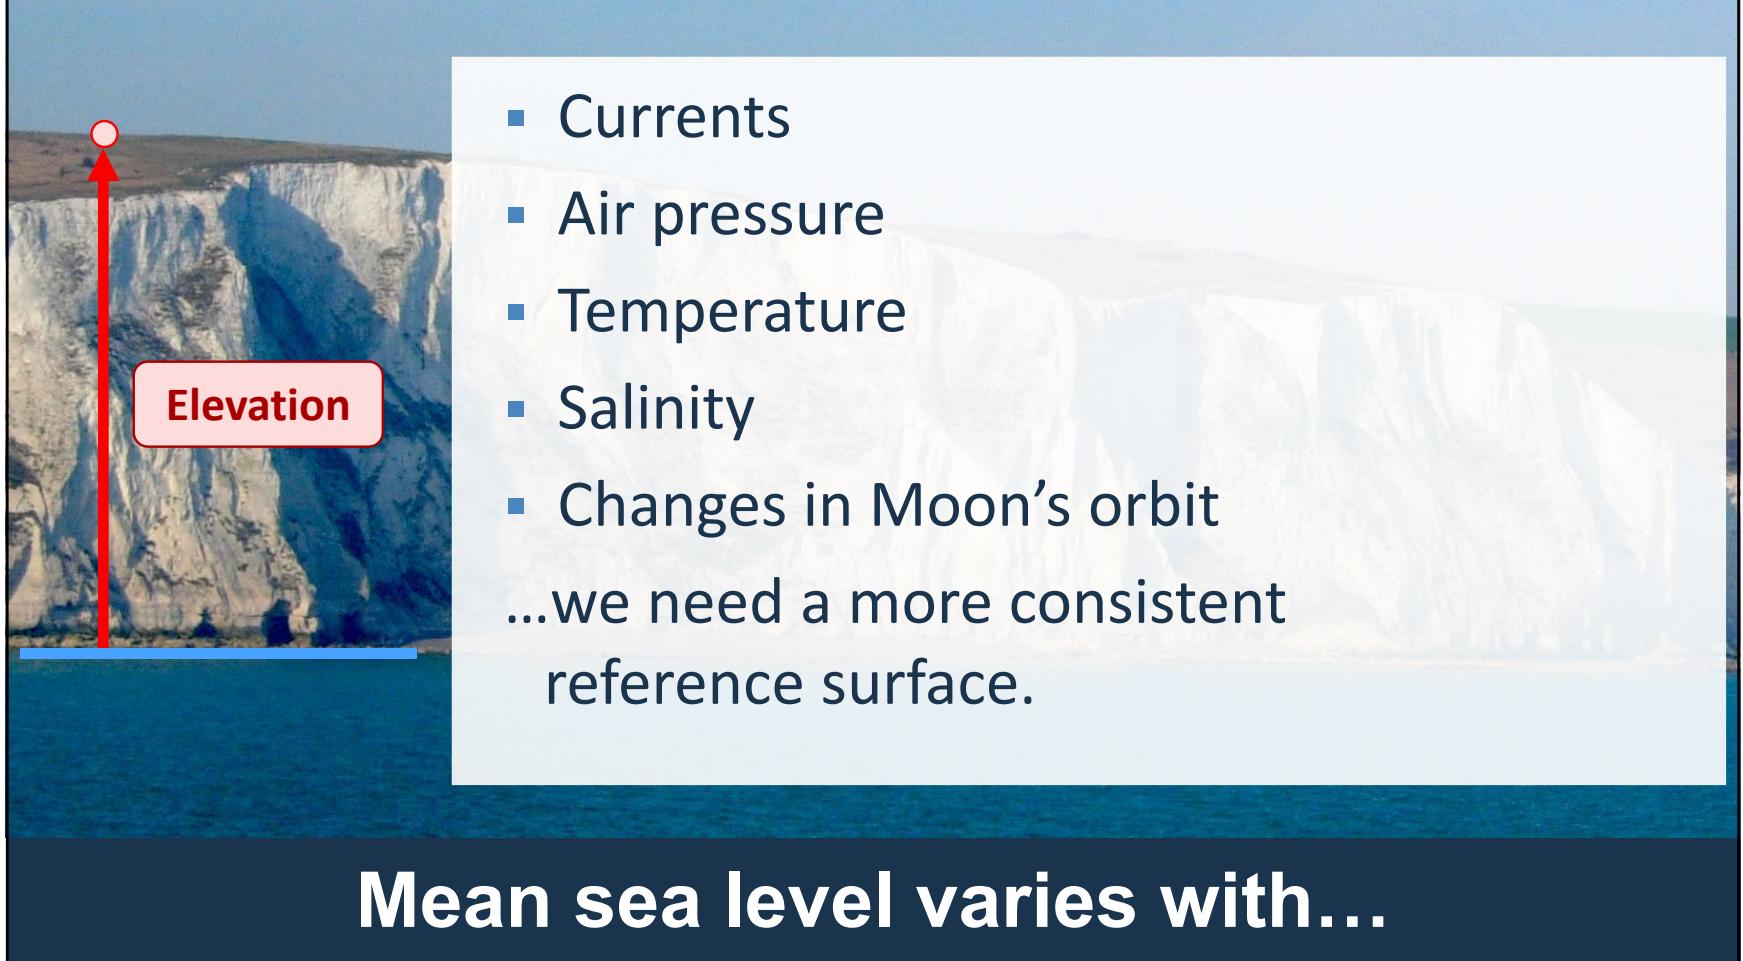

...assumes that water settles to a common level everywhere on Earth.

**What reference surface?**

- Measure water level at same place for 20 years
- Average out high and low tides
- Problem:
  - ◆ MSL will *still* vary with location, even along the same coastline.

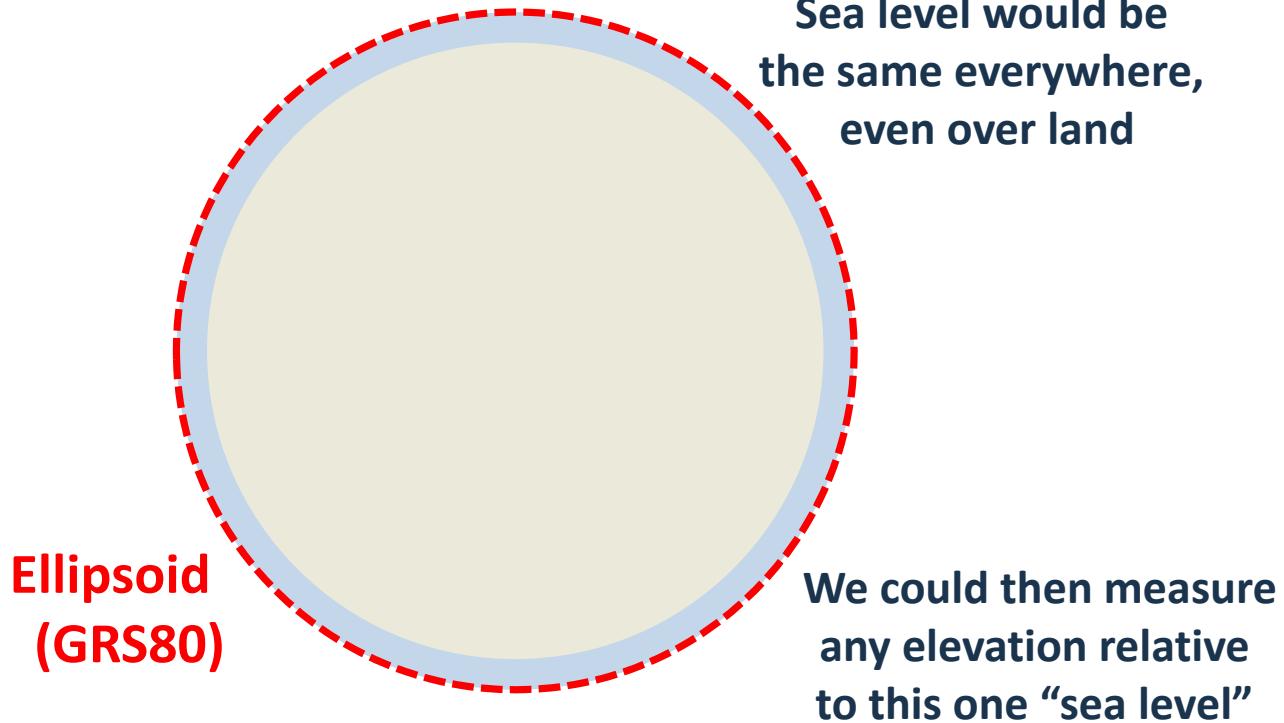

## Mean sea level

- Currents
- Air pressure
- Temperature
- Salinity
- Changes in Moon's orbit

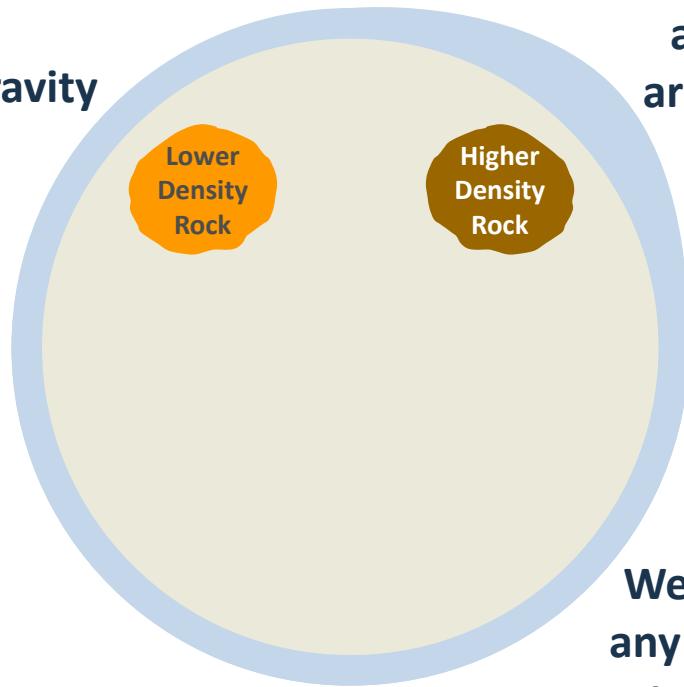

...we need a more consistent reference surface.

**Mean sea level varies with...**

If water could settle to one level...

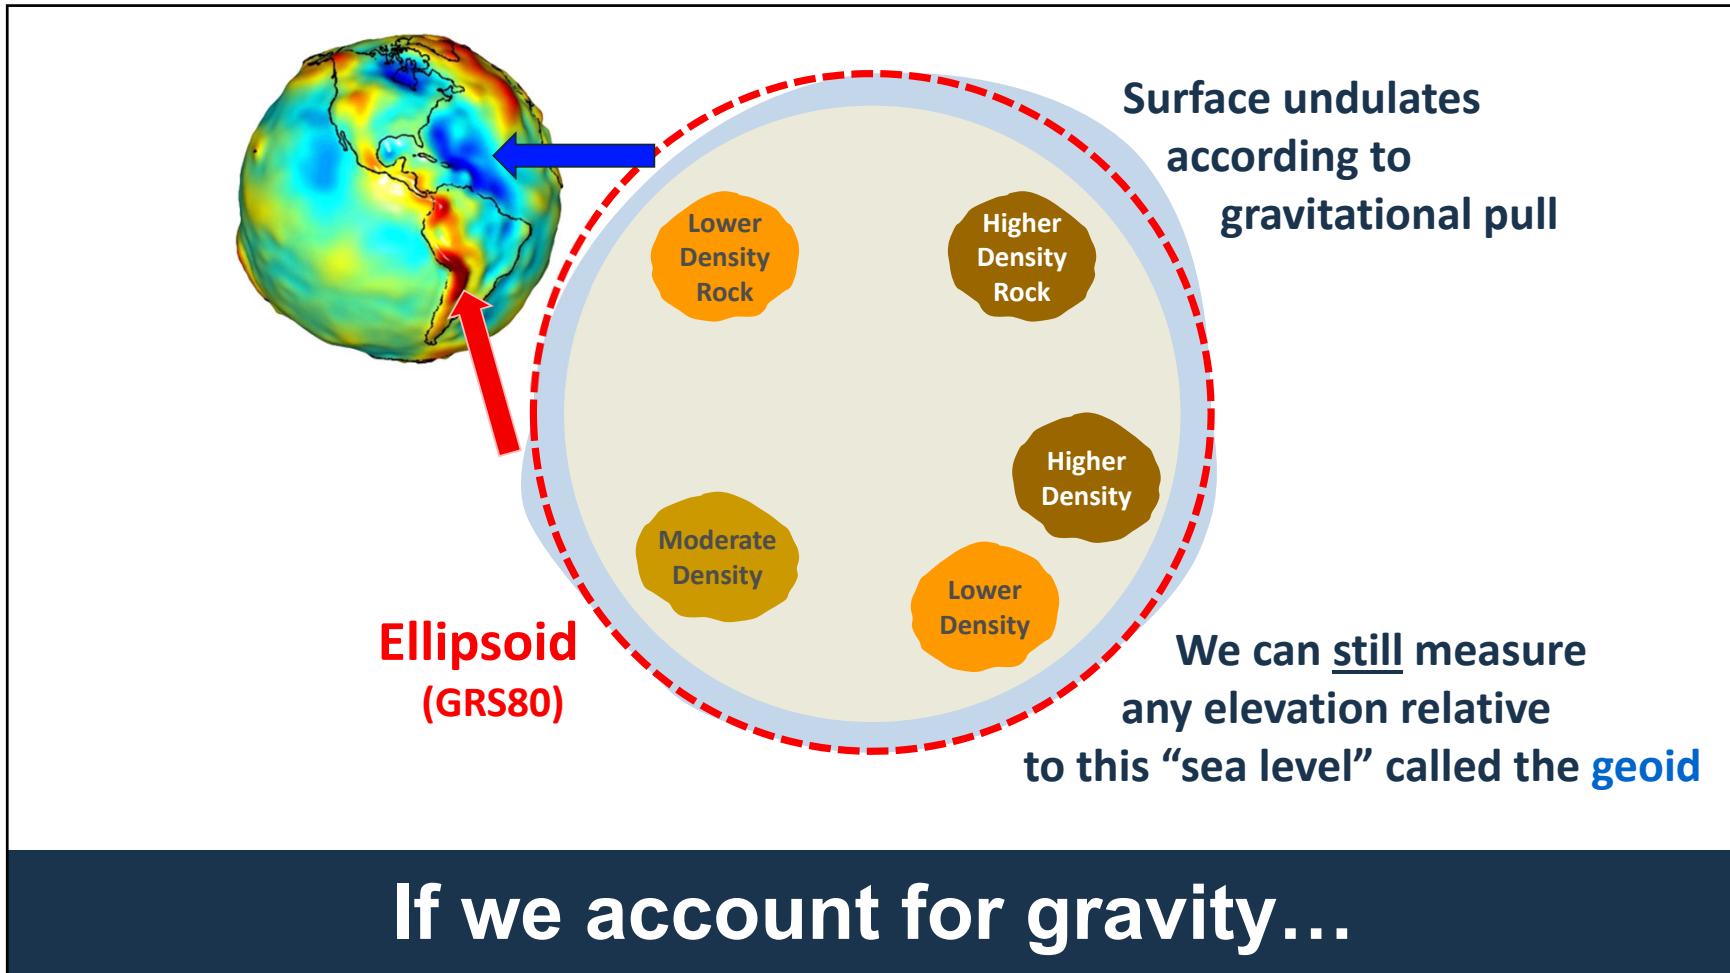

**Water is drawn  
away from  
areas of lower gravity**

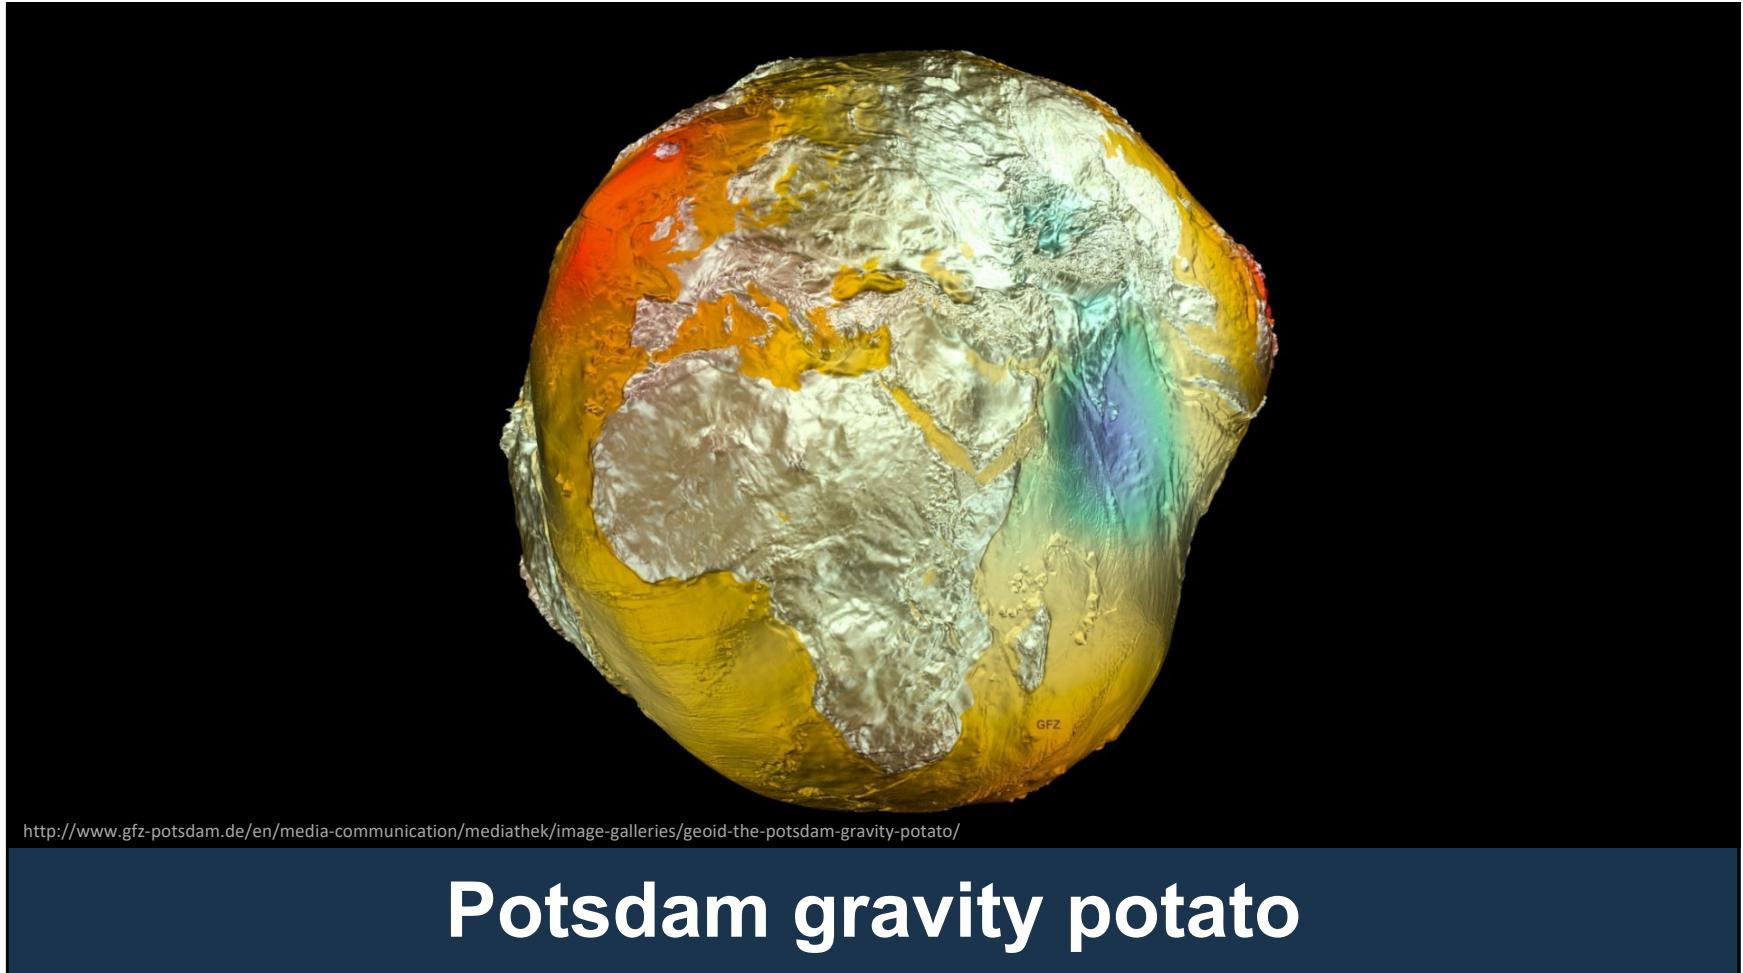

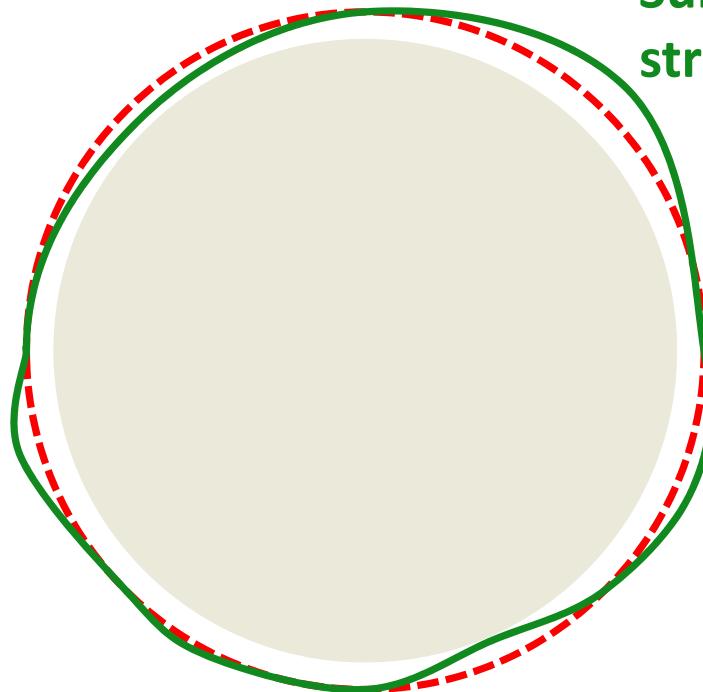

**Water collects  
and “bulges” above  
areas of higher gravity**

**We can still measure  
any elevation relative  
to this “sea level”**

**If we account for gravity...**

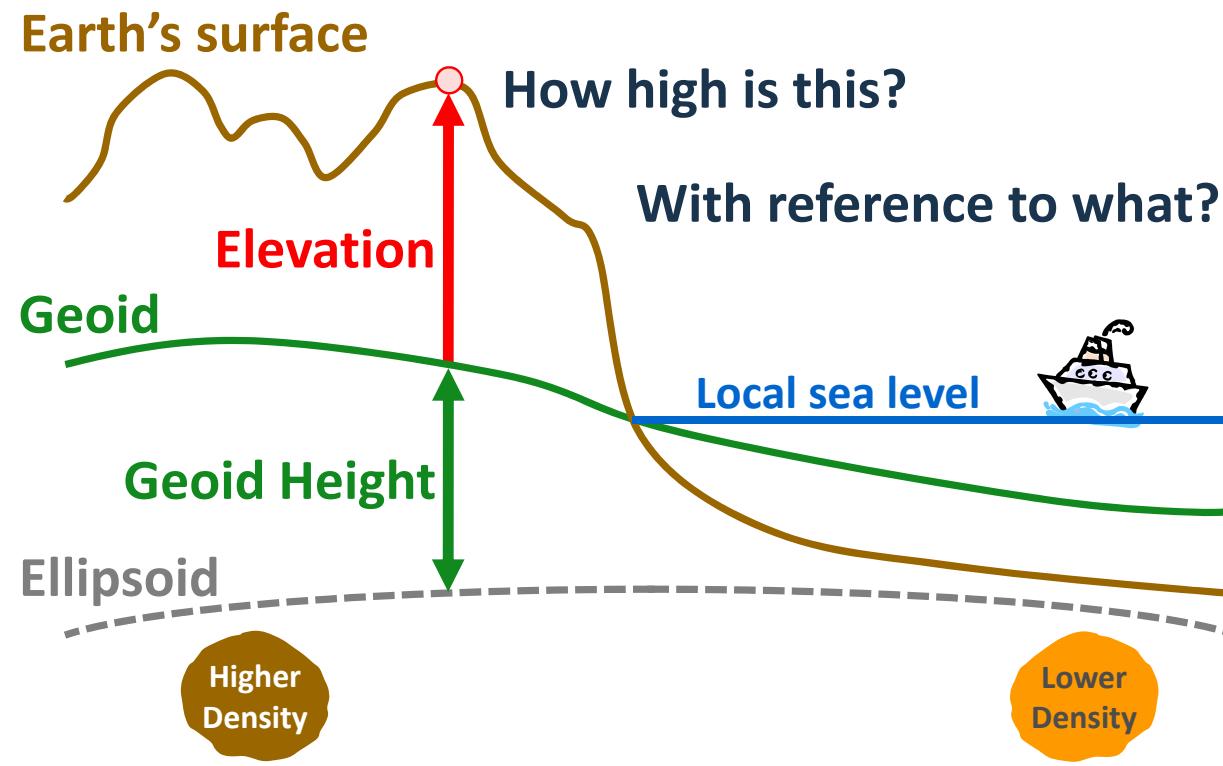

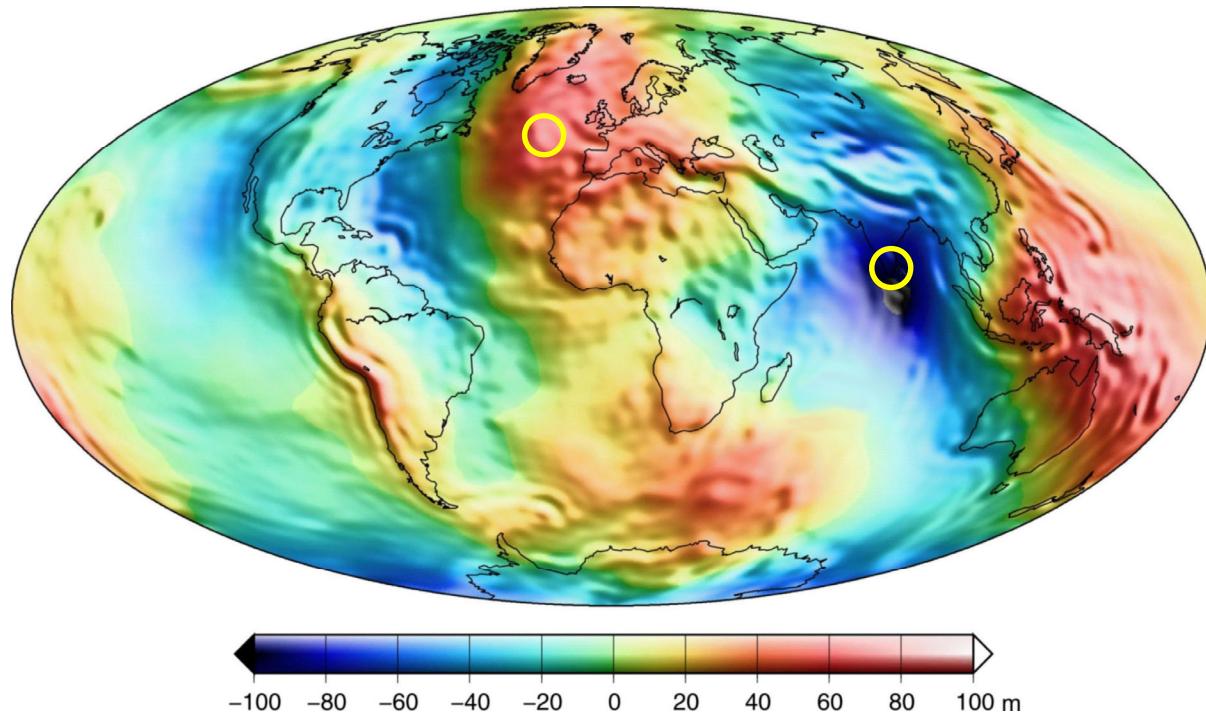

Surface with same  
strength of gravity  
as sea level

## Geoid

## Vertical Position
